THREADS cut with a Forbes are threads cut right. If the class of work you are doing demands accuracy —and most work does—you need a Forbes.

It is the only machine on the market with receding gear which carries the dies on to the pipe. Instead of turning the heavy length of pipe in the dies, it turns the comparatively light dies around the pipe. The steel is adjustable to compensate for wear.

A powerful, compact machine—saves labor because it can be carried right to the job. Does away with the old stock and die method.

Further particulars should interest you. We will gladly send them.

Equipment for the Standard Dumore Grinder

EQUIPMENT A

General Tool Room use. Includes high-speed internal spindle. Reach, 3 inches; speed, 30,000 R.P.M.; motor spindle speed, 10,000 R.P.M.

EQUIPMENT B

Deep Internal Work, 10-inch extension arm. Speed, 10,000 R.P.M.

EQUIPMENT C

Button Die Grinder. Speed, 50,000 R.P.M.

Another Dumore Grinder — The Dumore Junior

Spindle Speed, 20,000 R.P.M. Reach of arm, 5½ inches. Reach of extension, 2 inches. Net weight, 8 lbs. Gross weight, 12 lbs. Equipment: Six elastic emery wheels, 10 ft. cord, attachment plug and switch.

The Dumore Junior Grinder has been designed to meet the requirements of the manufacturer who desires a light grinder which will do accurate work, yet who does not wish to invest in a larger and more expensive tool. Invaluable for the accurate grinding of tools, dies and gages—can be quickly attached to lathes or other machine shop equipments. The

DUMORE JUNIOR PORTABLE ELECTRIC GRINDER

is built in the same conscientious manner, and embodies the same special features as the larger Dumore Grinders. The armature is dynamically balanced, and the spindle operates at 20,000 R.P.M. Friction is reduced to minimum by using high-grade Ball Bearings. This scientific construction has entirely eliminated vibration, and any work ground with the Dumore Junior will be found accurate and free from chatter marks.

Like all other Dumore products, this new grinder is sold on its merits. Write to-day for descriptive literature.

Wisconsin Electric Co., 1717 Dumore Bldg., RACINE, WIS.

Sold in England by Canadian-American Machinery Co., Limited, 8 Bouverie St., London, E.C., England

We are not Playing Checkers

Every man-jack of us at the Carborundum plant is working like the proverbial beaver, for never before has there been such a demand for Carborundum and Aloxite Products.

We are doing our level best to meet this big demand—enlarging our plants, increasing our forces, speeding up production—we are even building a big 20,000 horse power furnace plant in Canada in our efforts to keep up with things. We have a definite service to perform for we are helping to produce the necessities of war.

Carborundum and Aloxite Products are Doing Their Bit

They are grinding shrapnel shells, high-explosive shells, rifle barrels and parts—grinding bayonets and sabers. They are grinding a hundred and one different parts of the aeroplane and the auto truck, the machine gun and the field gun. They are shaping armor plate and grinding car wheels; grinding plowshares, and the tools of the metal-working trades of the world. They are grinding torpedo tubes and torpedoes, grinding submarine engine bases; beveling the lenses of periscopes and buffing the soles of the army shoes and grinding the shears for the pocket kits of the "Sammies." They are doing a thousand and one war tasks quicker and better than they have ever been done before.

Carborundum and Aloxite products are surely doing their bit, but with it all we haven't neglected for one instant our regular patrons—we are doing all in our power to keep up with the pace; to keep up to the standards of Carborundum service.

The Greenfield

For General Tool Room Work

This Grinder is furnished with attachments for grinding all kinds of milling cutters, reamers, counterbores, and other machine shop tools.

It is also suitable for cylindrical, internal and flat work which frequently turns up in the making of tools and jigs.

These attachments are all very simple in design and easily adjusted upon the machine, being graduated so that any desired angle can be at once obtained.

The whole machine is thoroughly well built, well finished and will be found a dependable, convenient grinder.

STERLING

HACK SAWS

Are known the world over for their efficient cutting quality which insures conomy and satisfaction.

You will make no mistake in buying "Sterling" Blades for the following reasons:

1st—They are made of the very best quality of steel rolled by any mill in the world.

2nd—The best mechanical construction which has been acquired by many years of experience.

3rd—Special heat treatment which goes to make the efficiency both for maximum quality and uniformity.

A trial will convince you.

MANUFACTURED BY

Diamond Saw & Stamping Works

BUFFALO, N. Y., U.S.A.

An Unbeatable Combination

An Unbeatable Combination

Are you a manufacturer of metal products, where accuracy, speed, production and economy count, and which require constant cutting-off of stock.

Here's The Combination You Are Looking For

The V. S. W. No. 5 High Speed Hack Saw Machine equipped with a VICTOR blade is unbeatable when it comes to increased production, and a minimum amount of power blade breakage and consumption.

Why?

An actual machine and blade operated by one of your own men in you own shop will be the most convincing demonstration we can make.

Let us send you one V. S. W. machine on a thirty days' trial, with enough VICTOR blades to show you why.

VICTOR SAW WORKS LTD - HAMILTON, CANADA

New York Shipbuilding Co. A Star Blade User

The New York Shipbuilding Company is one of the big factors that is helping to put our new navy and merchant marine on the war map. And in doing it, Star Hack Saw Blades are playing their important part.

The tremendous stress of ship production is carried back to every tool in the yard shops, and Star Blades are used for the most obvious reason that they prove more efficient.

Here's still another proof of Star Blade betterness that ought to impress every man who uses a hack saw.

When you are looking for the most efficient saw, play safe and follow the big concerns with millions in production at stake who have spent thousands to find out the facts. Do as they do and you will standardize on

STAR HACK SAW BLADES

Or make the tests yourself—for speed, for endurance or for low cutting cost and you cannot help coming to the same conclusions if you make a thorough test.

The Star was the first modern hack saw blade and for thirty years its distinctly better quality has kept it the largest selling blade.

This greater efficiency and endurance of Star Blades is no accident but the result of hundreds of thousands of tests of steel composition, of tempering, of relative dimensions and of shape and setting of teeth.

Then the standards set for Star Blades has been uniformly attained in production at every stage by special automatic machinery which gauges to the finest limits that make the smallest variation a mechanical impossibility. At the same time this special machinery gives us an enormous quantity production at a minimum factory cost.

If you are not satisfied with your present metal cutting results, have any reason to believe they can be improved or have any special cutting problems, write our Engineering Department, 230 River St., Millers Falls. We are at your service, regardless of what blades you are using.

FITCHBURG SIX-TWENTY

Bulk Doesn't Make a Grinder

any more than bulk makes a man.

Both watch and clock tell time. But isn't the little watch almost always the more reliable?

Bulkier Machines cannot grind more accurately than this compact Fitchburg Six-Twenty. Bulkier Machines fall behind when it comes to speed.

Occupying much less floor space, demanding considerable less effort, Fitchburg Six-Twenty best grinds all work within its range—and its range admits a big percentage of all Straight and Taper work.

The travel of the table is within control of a single lever, and may be started or stopped at any part of its stroke. Variable table dwell and automatic cross-feed with positive stop facilitate duplicate grinding.

Write us to-day for all the facts and illustrated catalog.

Fitchburg Grinding Machine Co.

76 Winter Street Fitchburg, Mass.

Cut shows Chuck on nosing operation. This is one of over two hundred in this Canadian plant.

This chuck is *built on the duplicate part system. It is simple, effective and fool-proof.*

It grips the shell in a predetermined position. The jaws will not slip on the shell. It has shell interior and exterior adjustable stops.

A trial on one of your lathes will convince you that this is THE chuck for shell work.

A Big Efficiency Unit in Your Shell Plant

A. J. LAVOIE'S

LOW PRESSURE

Compressed Air Chuck

This chuck can be applied to any make of lathe, without alteration to the machine, and will increase production from 25% to 75%. It grips and releases the shell while in motion—no need to stop your machine.

It is a single unit combination attached to the face plate of lathe, supported by an additional heavy duty bearing, thus making a heavy duty lathe out of a light machine. A small lever operates the chuck. Will operate with a pressure of 60 lbs. per sq. in.

MANUFACTURED BY

A Convenience—*that brings*—Economy

The Bowser System can be added to whenever more storage capacity is required. It is convenient, economical and fire-proof. Write for illustrated bulletin—to-day.

ECONOMY is the great thing to-day. It applies to every necessity; in the shop to time, labor and materials—it means quicker and greater production with less effort and cost. Production is increased when machines are lubricated properly; upkeep and labor is reduced and time saved.

Oil, therefore, is a necessity that should be protected by modern storage and handling facilities so that waste, careless handling, evaporation and deterioration of oil will be stopped, and the danger of interruption to production by fire, removed.

Ideal provision for the economical Storage and Distribution of Oil is embodied in the

BOWSER ESTABLISHED 1885

Oil Storage System

It is designed and built for any oil storage or distributing requirement, large or small, hand or power operated.

It is durable, accurate and safe; promotes efficiency, suggests cleanliness, lightens labor, and saves oil and money.

Every Shop Needs It.

Catalog No. 16 containing the complete line of Butterfield Tools awaits your request.

BUTTERFIELD

"Each Operator Averaged 10 More Shells per Day"

In his report to plant owner the works manager quoted recommended disposal of all remaining screw-operated box chucks.

His report was made three months after a partial change to Hannifin Air Chucking.

Six weeks later every lathe in the plant was equipped with Hannifin Air Operated Chucks.

At this time Hannifin Air Operated Mandrels were also installed.

The plant in question is producing 6-inch shells.

It is nothing unusual for Hannifin Air Operated Chucking and Clamping Equipment to add an extra day in time saved to each week.

In many of the largest plants in this country and Canada, Hannifin Air Operated Equipment has increased output from 20 to 80 per cent. In a number of plants it has actually *doubled* output.

If your work requires quick handling and rigid never-slip grip, for you to do without Hannifin Air Operated Chucking and Clamping Equipment is to do without profits within your reach.

Say you would like our catalog.

"FROST KING"—*the Mechanic's Friend*

The most exacting mechanics find in "Frost King" their ideal of babbitts.

Used in Canada's largest and most efficient plants because of its splendid performance under heavy duty. **Frost King** is an all-round babbitt and has wide use for all classes of stationary engines, traction rolling mills, planing mills, saw mills, pulp machinery, etc.

Use it for your most exacting requirements.

HOYT METAL COMPANY

EASTERN AVE. and LEWIS ST., TORONTO, CANADA
New York, N.Y. London, Eng. St. Louis, Mo.

Effective, comfortable eye protectors for chipping, lathe work, grinding, rolling, cupola and furnace work, pouring, tempering, cement burning and packing, electric welding, acetylene cutting, quarrying, laboratory work, truck and engine driving, military service, and every kind of industrial work.

Albex Eye Protector, with headband, price $1.25 per pair, or $9.60 per dozen, including steel cases. This goggle for drivers, machinists and grinders is also the standard military goggle. Nearly 100,000 were in the U.S. army service in 1916, the War Department purchasing 50,000. The large 1917 purchases by the United States and British Governments for truck driving, field work, munition making, etc., cannot be stated at this time.

Full particulars for Canada from Toronto Office, and for Great Britain from London Office.

T. A. WILLSON & CO., Inc., Factory in Reading, Pa., U.S.A.

First Cost of Lamps is forgotten when you know

LACO NITRO LAMP "THE LIGHT THAT GIVES MORE LIGHT"

SAVES 30% TO 50% OF THE CURRENT NEEDED

Even a trifle higher price is offset by the great saving in current consumed for 1000 candle power for 1000 hours.

ASK YOUR DEALER.

CANADIAN LACO-PHILIPS COMPANY, LTD
Stocks Available at Montreal, Toronto, Winnipeg, Vancouver

CUT YOUR SHOP COSTS

Nobody would think of putting 16-inch lathe work on a 30-inch lathe, then why leave small parts on a large Milling Machine?

A Steptoe Hand Miller or small power feed can be handled quickly and will cut your production cost. You will have less money invested in your Milling Machines and have more machines to do the work.

That same principle applied to your small planer work will cut the cost of planer work.

A Steptoe Shaper will do the work faster because it can be handled quicker.

The John Steptoe Company, CUMMINSVILLE CINCINNATI, OHIO, U.S.A.

Accurate Quantity Production

CAN BE OBTAINED
THROUGH THE USE OF

"MORSE" DRILLS

AND NOW IS THE TIME TO ORDER WHEN RAPIDITY OF ACCURATE PRODUCTION IS THE GREAT NEED OF EVERY MANUFACTURER.

CATALOG ON REQUEST.

MORSE TWIST DRILL & MACHINE CO.
NEW BEDFORD, MASS., U.S.A.

Dominion Cast Steel Parts

Open Hearth Products

Machinery Castings of all kinds, Motor Frames, etc., for electrical trade, Pedestal and Miscellaneous Bridge Work, Rolling Mill and Blast Furnace Castings, Gears and Gear Blanks.

We are also prepared to furnish steel plate to 20" wide—for prompt delivery.

We have recently increased the capacity of our plant and can guarantee quick delivery on castings weighing anywhere from 100 lbs. to 50,000 lbs.

Quick Deliveries

RHODES

Vertical and Horizontal Shaper Gives Maximum Efficiency at Minimum Cost

Don't do your shaping and slotting, tool-making, die-making, modeling and other classes of light work on big and expensively-operated machines when all this work can be done more accurately, quicker and cheaper by far, with the RHODES Machine. Being introduced all over the world on their cost-cutting merits.

They will increase your profits. Look into the matter. Write for description of various types—do it now.

For the Reason the Wood is Steamed and Bent with the Grain

RICH

Drills are Forged and Twisted Hot

The high-speed tool steel in Rich Forged Drills, Reamers and Bits remains as strong as the solid bar. Forged—instead of milled—the fine grain of the steel is not cut and weakened. Consequently, extra tough work at highest speed is ordinary work to Rich Forged Tools. They never burn or bind.

In lasting service you will find that Rich Forged Tools are as different from ordinary milled tools as solid oak furniture is different from glitter and glue. But the surface difference to the average man is not discernable. Therefore, when buying Drills, Reamers and Bits, know for certain that each is stamped: Rich Tool Company.

Machinery and Supplies

Everything in equipment for new plants, factories and mills is obtainable from us. Our special service department will give your enquiry careful thought and make suggestions without charge. Write us for your new equipment and supplies.

Standard Machinery & Supplies Limited

The Plant Behind the Drill

It has always been a feature of Celfor Policy to spare neither money nor effort in keeping our plant and drill making machinery up to a standard, productive of the highest efficiency in drill manufacture.

We are in a position now as never before to carry out this feature of our policy, through the recent merger of the Celfor Tool Co. with the Buchanan Electric Steel Co., in the new corporate form of the Clark Equipment Co., for this merger has made possible added capital and financial resources with which to carry on our business.

We solicit your inquiries for information regarding Celfor Tools either through our perfected dealer organization or addressed to our main office, whichever is more convenient.

Silver's 20" Swing Drills

ARE NOTED FOR THEIR

ACCURACY, STRENGTH AND SPEED

Over 400 are used by

The Willys-Overland Motor Co., Toledo, Ohio.

and

The Curtis Airplane Motor Corp., Buffalo, N.Y.

These firms KNOW their quality. Whether you need 1 drill or 500, it will pay you to use a SILVER.

Just Out! Our New Catalog No. 63, covering Silver's 20-inch and 25-inch Drills, Post Drills, Etc.

Send for it and our attractive prices.

The Silver Mfg. Co. BOX 290 **Salem, Ohio**

12,000 R. P. M. and No Vibration No Friction

That is the top speed of 5 speed changes. For drilling up to 3/16" it is maintained with ease and perfect safety. At lower speed, capacity for soft materials is ⅜". Also built for ½" and ¾" capacity with maximum speeds of 5,000 r.p.m. and 2,500 r.p.m. respectively.

Demco

Ball-Bearing-throughout Drilling Machines are built in 1, 2, 3, 4 and 6-spindle types, complete with lower countershaft. Vertically adjustable quill bracket insures permanently true alignment of the drill. Belt adjuster and automatic take-up maintain the belt at constant uniform tension.

Demco will speed your output and lengthen the life of your drills. Nothing equal or better regardless of price. *Write to-day for Bulletins.*

FLINT SHOT'S WIDE RANGE IN SAND-BLASTING PRACTICE

Flint Shot users include almost every known metal-working industry.

Steel Foundries depend upon it for cleaning such mammoth castings as are shown in our illustration.

Makers of tiny brass parts for electrical work find it equally adaptable to their needs.

And between these extremes belongs so wide a range of products that their mere cataloguing would require several pages the size of this.

Iron, steel, semi-steel, and malleable castings are best sand-blast-cleaned with FLINT SHOT.

Brass, bronze, aluminum and other non-ferrous castings equally so.

Plates, sheets, bars, stampings, forgings—all metal surfaces that carry foundry, mill or furnace scale are most economically and most effectively cleaned with this pearl-like pure-flint.

Its cleanness, hardness and uniformity; and its remarkable lasting qualities are causing it to replace natural sands, everywhere.

Send for our "Little Journeys"—a veritable text book on sand-blasting.

And, when you write, ask us to send you our envelope-sample of Flint Shot.

MAKE NAILS! NOT NOISE!

We offer the trade new types of

WIRE NAIL MACHINES

QUIET IN OPERATION; WITH VERY HIGH OUTPUT; ALL PARTS ACCESSIBLE; DECREASED MAINTENANCE COSTS; GREAT CAPACITY; OCCUPYING SMALL FLOOR SPACE.

Smoothly running machines, with balanced mechanical motions and no rotating cams. Built in 5 sizes, handling wire from No. 17 to ⅜" diam.

PRACTICALLY NOISELESS IN OPERATION

Sleeper & Hartley, Inc., Worcester, Mass.

Built To Cope With Modern Ways

To meet with the demands of the day successfully the Crank Shaper must be a machine that can take care of a variety of work with the least adjustment.

THE

HENDEY
CRANK SHAPER

Has been carefully studied in every detail of its design in order to furnish a shaper equal to all present-day needs.

Write for complete description of this profit-making machine.

For Quick Heats

A good rivet forge must be dependable —it should stand up under hard service and give quick heats.

Our No. 625 forge has securely riveted, heavy steel-plate fire pan mounted on well braced ¾" tube steel legs. Heavy round tuyere distributes heat to best advantage.

Blower — high speed — ball bearing — silent.

Catalog No. 18C-16 tells all about Canadian Forges—write for a copy.

Special Turret Lathe

For Boring and Profiling 6-in. H. E. Shells

Particular attention has been paid in the design of this machine to ensure rapid production on shell work. It embodies all the best principles, too, for the maintenance of accuracy.

With its speed and accuracy it represents a combination that works for the best method of economy in production.

We can offer a few of these machines for prompt shipment, subject to prior sale.

Detailed specifications, photographs and prices sent on request.

SMALL TOOLS

P. & W. TAPS

Insure the Greatest Accuracy

The Taps with the Con-eccentric
Trade-Mark Registered
Land

As will be seen by the cross-section cut above, one-third of the land from the cutting edge is concentric. The remaining two-thirds is eccentrically relieved. A tap made in this way can be ground for sharpening at the only correct point—on the face of the cutting edge. Sharpening in no way affects its size or the form of the thread.

The Taper Tap has a cylindrical pilot and on the chamfered portion of the tap the top of the thread is relieved clear to the cutting edge to secure keen cutting qualities.

The construction of Pratt & Whitney Taps not only insures greater accuracy and refinement than has heretofore been possible to obtain in a commercial tool, but also insures the freest cutting tap with the longest life—an exclusive P. & W. Combination.

TORONTO December 13, 1917

Big Business Ahead

AS announced in Canadian Machinery recently, Canadian munition makers are receiving orders which will carry them far into the new year. This means more buying.

The United States Government is placing contracts with our manufacturers for immense quantities of a certain type of shell. This means more buying.

Canadian firms are securing large orders for ship deck machinery, such as steering gears, windlasses, winches, cargo hoists, etc., as well as engines, pumps and lighting sets. This means more buying.

Shipbuilding is booming and will continue to boom. This, too, means more buying.

Next year will probably be the busiest our metal working industries have ever had. Much buying of equipment will undoubtedly take place. How are you going to influence *your* share?

For the sake of the small investment required you cannot afford to miss the opportunity offered by the Annual Review Number of Canadian Machinery, December 27.

An advertisement in it—large enough to properly present your selling message—will enable you to reach buyers all over the country, and in a number that will be preserved for months.

It will appear at a time when buying will commence in earnest—just at the beginning of the new year. The elections will be over and much of the unrest they are creating will have passed away. The success of the Victory Loan will give fresh confidence and will stimulate buying to a wonderful extent.

There could be no better time for the appearance of our Annual Number. And there is no better medium for reaching buyers. It is significant that many firms who used our last Annual Number have reserved increased space this year. One firm will have twenty-four pages, another twelve, others eights, fours, etc. Many advertisements will be in two or more colors.

Copies will be sent abroad to our export list.

First forms went to press December 1st; last forms close December 20th. Rush your space reservation and send copy as soon as possible. And send your cuts by *mail*.

LITTLE WORDS WITH BIG MEANING

Quality

According to "Webster," Quality is "an excellence of character; natural superiority."

Service

Webster's definition of "Service" is; "The performance of labor for the benefit of another."

We use these words advisedly—fully understanding their definitions—and realizing the obligation we place upon ourselves by their continued use in connection with our products of Iron and Steel, and our attitude to the people we serve.

SKF

No. 2 of a Series of S K F Equipped Lathes

STRENGTH

A single S K F carries the total thrust load, 125,000 pounds, in the lathe shown below. To stand this tremendous thrust in this Niles Lathe, the bearings must have capacity for heavy loads. S K F Thrust Bearings are designed to accept heavy loads without heating.

Your lathes must withstand thrust equally well. S K F will help solve your problem. The S K F engineering service department has helped others. It can help you.

The Johnson Friction Clutch Is Being Used As A Part Of This Machine

Here

Courtesy of Foote-Burt Co., Cleveland, Ohio

The Johnson Friction Clutch is used in the throw-out back gears in this new 15½ Foote-Burt Multiple-Spindle Machine.

"Records Are Much Better Than Promises"

That is the reason why we run the cut at the top of the page, driving home the record, "the Johnson Friction Clutch is being used as a part of this machine."

Week after week has the evidence been piling up as to the extensive use of the Johnson Friction Clutch in various types of machines.

And this record of wide use is duplicated by another record of satisfactory service.

Single Clutch—Interior.

The Johnson Friction Clutch embodies all the principles which make a perfect friction clutch. Our YELLOW DATA SHEETS and Booklet, "Clutches as Applied in Machine Building," explain this fully. Will you have them?

Compressor Problems Vanish

In a comparative test the quality of a machine will then be judged fairly. We invite your comparison. Our confidence that these machines excel is not only based on our knowledge of their construction, but also because of the manner in which they appeal to our customers. We know they are built right. Our patrons have proved it. Let us get together.

URANIUM

HIGH SPEED STEEL

We have often been asked, "What gives Uranium High Speed Steel the toughness and strength not found in the ordinary high speed steel?" The answer is that by combining the proper amount of uranium to our mixture a high speed steel of the finest quality is produced—a steel that works at greater speeds, takes deeper cuts and lasts longer.

Consult your steel man or write us for full details.

"CoCo" Turning Steel

"CoCo" Goes on Working Long After Other Steels Stop

"CoCo" will do the same in your shop—will cut faster or longer than other steels. Here are some proofs:—

"CoCo" is cutting Semi-steel Castings at 100 ft. per minute, cut ½" deep. 30 hours continuous service between grinds.

"CoCo" is turning Cast Iron Hydrant Caps at 169 ft. per minute, feed ⅛", cut ⅜" and turns 4 hydrants per grind where less than one per grind used to be standard.

"CoCo" is turning .40 Carbon O. H. Forged Rams at 95 ft. per minute, feed ¼", cut 3/32" turning 3 rams in the same time it formerly took to do one.

CAN YOU BEAT IT?

"CoCo" Steel does not do stunts—It does the work. It will do yours as well. Ask us.

COLONIAL STEEL COMPANY

PITTSBURGH BOSTON DETROIT NEW YORK PHILADELPHIA ST. LOUIS CHICAGO

If interested, tear out this page and keep with letters to be answered.

THE Crank Shafts of all Consolidated Presses are made from .50 to .60 carbon steel hydraulic forgings, accurately machined and ground to size. The body bearings are carefully scraped to fit, thus insuring a perfect bearing.

The Crank Pins are larger in diameter than the main bearings. This has always been a Consolidated feature. Crank cheeks are liberal and guarantee strength and rigidity in the shaft; this, together with the enlarged crank pin, materially resist torsion when the press is in operation.

You cannot ignore these features.

"EVERYTHING IN MACHINERY"

Power is Costly--- Don't Waste It

A STRIKING feature of the Chicago Automatic is the 100 per cent. utilization of power. Operated by a single belt run direct from the lineshaft, troublesome overhead belting and countershafts, with the power they waste, are eliminated, making it easy to install one or a battery of these machines.

Equally as important is the general simplicity of construction; there is no reversing or belt shifting, no complicated mechanisms, and all parts are readily accessible. Action is positive. results unvaryingly uniform and accurate. The machine is extremely well built in every particular and produces fine work at very low costs. Made in ¾", 1¼", 1⅝", 2" sizes. Roelofson 6-in. Banding Machine

YOU couldn't imagine a more sturdy, compact, serviceable machine than this! A glance at the illustration will show you for yourself. It has been used in Canadian munition plants since the munition business started, and is still giving absolute satisfaction. It's the machine you need if you make shells.

Look over the following outstanding features of its construction:

Integral (en bloc) construction assures perfect rigidity, permanent accuracy and desirable compactness.

Chucking with spring collet chuck insures accurate and speedy chucking.

Graduated feed dial, two cutting tools, and ample belt power insure output of accurate work in least possible time.

Machines are built for 15, 18, 60-pdr. and 6" shells.

Roelofson Machine & Tool Co., Ltd.

Head Office: 1501 Royal Bank Building, Toronto, Canada
Works and Warehouse: Galt, Ont., Canada

Immediate Delivery

To shell plants changing over from the manufacture of the larger sizes to 6" shells, our ability to make **immediate delivery** should be of especial interest.

And remember that the Roelofson is one of the few banding machines that have stood up from the first of the munition game and are still doing duty.

Cutting Iron and Steel by Oxy-Acetylene Process

Examples of Cutting by an "A.L.S." Oxycutter.

Wherever the Cutting of Iron and Steel is necessary, this method is universally adopted, with a **Saving of Time, Money and Labor.** An "A.L.S." Oxy-Acetylene Welding Outfit may be instantly converted into a complete cutting unit by the addition of an "A.L.S." Oxycutter.

For Cutting manholes and portholes in Steel Plates; Burning off rivet heads before driving out rivets; and hundreds of other similar purposes, the Oxy-Acetylene Process is more economical and efficient than any other method, and sometimes performing work otherwise impossible.

WHY NOT LET US TELL YOU HOW MUCH YOU CAN SAVE?

Many firms have not yet realized all that Oxy-Acetylene Welding and cutting will do for them. You may be one of them. If so, write to-day, we shall be pleased to give you all the information necessary to enable YOU to judge how much YOU may benefit by the Process. An ordinary purchaser of an Outfit saves the cost many times over during a year, many save the cost on the first job. Is this not worth investigation?

A few minutes of your time will enable us to put before you the result of years of experience.

WHITING FOUNDRY EQUIPMENT CO.
HARVEY-ILL. U.S.A.
CHICAGO SUBURB

"Over the Top"

Right down in the front trenches of metal working, in the no-man's land of production, the

Starrett Hack Saw

is doing its bit. The sharp, hardened tungsten steel teeth cut their way through rod or sheet, steel or copper as a machine gun cuts its way through opposing infantry.

While the excellence of Starrett blades has long been an accepted fact, never before have they been accorded the confidence they enjoy to-day. The rush and bustle attendant upon forced production have created a demand for a hack saw blade that will "stand up"—cut quicker and last longer.

Because we have made careful and thorough tests we are able to tell you just which numbered blade is best suited for each class of work. The result of these important tests, together with the unexcelled quality of Starrett Hack Saws, have placed our blades in the first rank of industrial preparation.

What blade to use is indicated on page 208 of our Catalog No. 213. Send for your copy.

"Forbes Facts"

1. One man can do the work of six against the old stock and die method of cutting.
2. It is the only machine on the market with receding gear.
3. It is self-contained and motor-driven.
4. It is portable.

These are convincing arguments for the construction and utility of this machine. Thread cutting can be performed fast, clean and true. Equipped with self-centering vise.

The Curtis & Curtis Co.
115 Garden St., Bridgeport, Conn.

Decidedly Quality

That is the verdict of our clients.

In construction, operation and results, quality is evident. That is the reason why Filsmith has occupied the foreground in lathedom. In Canada and United States you will find Filsmith quality is based on what it is now doing, not on history. Full webbed headstock, 50-point carbon steel spindle, and rigidly clamped tailstock.

An enquiry will secure you full information.

THE PHILIP SMITH MFG. CO.
SIDNEY, OHIO, U.S.A.

13-inch Engine Lathe

For Rapid Production and Accurate Work

USE THE

"BRIGGS"

The Briggs Miller handles work no other machine of its size can touch. It is a manufacturing machine. On account of its rigid construction it will produce accurate work when running at a high rate of speed and feed.

The Base Tank and Large Gear Pump is the latest addition to its many advantages. Tank holds 20 gallons of cutting lubricant

Pump never requires priming and will deliver ten gallons per minute to the cutters, keeping them cool when run at very high speed.

Our booklet describes fully. Drop a card for it.

6" Boring — 75 Rough 100 Finish

10 HOUR DAY

A close study of the above chuck will reveal strength that enables this machine to give this production *all the time* in 10 hours. The illustration below shows the wonderful sturdiness of the machine. Inquire of us. The prices are exceptional. Made in Canada.

The Plessisville Foundry

PLESSISVILLE, QUEBEC

Cut shows Chuck on nosing operation. This is one of over two hundred in this Canadian plant.

This chuck is *built on the duplicate part system. It is simple, effective and fool-proof.*

It grips the shell in a predetermined position. The jaws will not slip on the shell. It has shell interior and exterior adjustable stops.

A trial on one of your lathes will convince you that this is THE chuck for shell work.

A Big Efficiency Unit in Your Shell Plant

A. J. LAVOIE'S

LOW PRESSURE

Compressed Air Chuck

This chuck can be applied to any make of lathe, without alteration to the machine, and will increase production from 25% to 75%. It grips and releases the shell while in motion—no need to stop your machine.

It is a single unit combination attached to the face plate of lathe, supported by an additional heavy duty bearing, thus making a heavy duty lathe out of a light machine. A small lever operates the chuck. Will operate with a pressure of 60 lbs. per sq. in.

MANUFACTURED BY

The Montreal General Tool Co.

673-5 Notre Dame Street, Maisonneuve, Montreal, P.Q.

Also manufacturers of shell tools, and special machine attachments of all kinds made to order.

Cutting-off and Threading

By the decree of expert judges Williams Cutting-off Machine has been declared the most **efficient.**

We have made this claim all along and this judgment only verifies it.

Made in 11 sizes and each size has a range of 8 to 10 consecutive sizes between 1/4" and 18" diameter.

Write us about them. They will save you money, time, and increase the quality of your product.

400 Shafts and Shoulders in 10 Hours on a NORTON Grinding Machine

If you are doing roughing or finishing in a lathe, these figures will be interesting —and may open your eyes! This record is not a sprint, stunt or stampede— simply an every day, all day, steady jog with the Gemmer Mfg. Co., Detroit

The subject shown is part of an automobile steering worm mechanism. Shaft is 5½-in. long, 1⅛-in. diameter. Carries a shoulder 2-in. diameter by ⅜-in. wide which must be at right angles to the shaft. The limit is very close. Production is 400 in 10 hours.

Do you know the Norton Grinding Machine in very many shops is superseding **both roughing** and **finishing** on the lathe? Doing the work in less time, with less labor and greater ease in handling? The finished result admits of no comparison.

The advantages of Norton Grinding Machines are past enumeration here. If you will just write us we'll go into the subject as far as you like.

If interested, tear out this page and keep with letters to be answered.

A Time And Money Saver

THE ACORN DIE

will save time and money for you because the wear is borne equally by all four lands—due to the improved method of adjusting—consequently the die lasts longer.

It will save money for you because there will be fewer rejections for poor threads.

It will save time spent in grinding because it will run longer between grindings—another result of the adjusting feature, which distributes the wear equally on all lands.

It will save time in "set-up" because when a dull die is removed from the holder for grinding, a new one can be substituted, the cap screwed on and the machine is ready for work again.

It will save time on repairs or breakdowns because it is simple and there is nothing to get out of order.

Extremely accurate adjustment is obtained by turning the cap—see illustration—which forces all four lands an equal distance towards a common center.

Investigate this time and money-saving die at once.

Send for a copy of our Acorn Die booklet.

Notes on Machining Operations on 75mm. U.S. H.E. Shell

By M. H. Potter

While similar in general principle to known types of high explosive shells already produced in this country, the 75-mm. U.S. high explosive shell varies in detail,—the provision of a base protecting plate, walls of comparative thinness, a nosed-in mouth, and the acceptance of a forged interior finish are among the principal features of the design. The knurled band seat is already familiar through Russian work, but the internal hydrostatic test is an additional requirement not hitherto met with in other shells.

IN the following description of machine work on the 75 mm. shell as now being produced in this country for the United States government, the sequence of operations is such as to be readily adaptable by the majority of existing shell shops. Change of sequence, and subdivision of any particular operation into two or three stages may be undertaken if rendered advisable by special individual conditions.

When women operators are employed it has been found more practical and better results have been obtained when each operation is as simple as possible. The shells are light and therefore easily handled. This of course is only true when air operated chucks are used.

The principal dimensions and working limits of this shell are as follows: Diameter of body proper and base 2,925 in. + .005 — .010: diameter of body above shoulder 2.938 in. + .00 — .005: diameter at nose 1.88 in. + .010: length over all 10.39 in. + .08; width of groove (no undercut) .48 in. + .01: thickness of walls .318 in. + .01 in.; over all diameter of driving band 3.008 + .003; thickness through nose .83 in., (not habitually gauged): length of threads in nose 1.397 in. + .000 — .006: the threads are U.S. standard form, 12 per inch; diameter over threads 1.397 in. + .000 —.006: diameter fuse hole rear of threads 1.54 in. + .20: angle of fuse hole 60 deg.

The base cover plates consist of one disc of lead 2.22 in. dia. and one sheet of brass 2.56 in. dia. with the edge turned at 45 deg.

The shells are heat treated practically the same as the British shrapnel, and the accompanying illustrations show the shell during the various machining operations, the details which apply to each operation being enlarged in the sketches to facilitate reference.

FIG. 1.

Cut Off

1st operation, Fig. 1. Special cut off machine or engine lathe with plain barrel chuck having four set screws to tighten against shell. The two cut off tools are opposite each other and fed towards the centre. The depth of bore is gauged (see A. Fig. 1). B is checked before this operation to make certain that the forging will clean-up on the base.

FIG. 2.

Centre

2nd operation, Fig. 2. Engine lathe with expanding mandrel having two sets of three jaws each, one set to grip shell close to the closed end the other just forward of the open end. The special fixture consists of a drill spindle with racks and pinion mounted in a casting having a vee slide to enable operator to slide the fixture to the rear when placing or removing shell. The base is clamped to the ways of the lathe. A special drill with no body clearance and a 60 deg. point is used. The shell is gauged for concentricity before this operation (see B Fig. 2), and A (see Fig. 2) is gauged.

FIG. 3.

Rough Turn

3rd operation, Fig. 3. An engine lathe is used with a mandrel having three fixed tool steel hardened jaws set at a slight taper in a machine steel shank to fit lathe spindle centre. The tail stock centre is applied to the centre in the closed end of shell. The cutting tool employed consists of a machine steel shank with a welded stelite tip—A (see Fig. 3) is gauged.

FIG. 4.

Bore

4th operation, Fig. 4. Rough and finish bore on a turret lathe. Three or four boring bears employed. The shell is held in a clamp or collet chuck. The first bar, which may be omitted, has a short cutter for removing the scale from the bottom of the bore, the second bar has the cutter for the straight part, the third bar the contour cutter for roughing (old cutters from the fourth turret

FIG. 5.

notched) the fourth bar carries the finish contour cutter. A and B are gauged (See Fig. 4).

Face Base

5th operation, Fig. 5. The shell is held in a collet chuck, it being forced against a stop fixed in the centre of the chuck. This enables the operator to set the tool the required distance from the stop, another stop on the carriage is then set which prevents a low base. Although a lathe can be used to advantage, special open end machines are more suitable. A is gauged (see Fig. 5).

Re-centre

6th operation, Fig. 6. This operation

FIG. 6.

is carried out the same as operation 2. A (see Fig. 6) is gauged. This operation is necessary as the centre is used for re-rough turning and grinding the outside of the shell.

Re-rough Turn

7th operation, Fig. 7. The shell is held on an expanding mandrel as in operation 2. A is gauged (see Fig. 7).

Bevel and Face Open End to Length

8th operation, Fig. 8. The shell is

FIG. 7.

held as in operation 5 but with the open end protruding. A special block tool holder is used. The chamfering tool is held at right angles to the shell (in front). The facing tool is in line with the shell. This operation is taken care

of by a lathe, the tools being set and the carriage feed put on. When the carriage almost reaches the stops, the operator releases the feed and runs the carriage up against the stop by hand. The cross feed is not required. A, B and C are gauged (see Fig. 8).

FIG. 8.

FIG. 9.

Nose in

9th operation, Fig. 9. A hydraulic press is used. The open end of the shell is heated in an oil or gas furnace, an oil furnace being preferable. The shell is then placed in the press against three locating pins, the die brought down and the shell nosed in. Although cast iron dies are successfully used, machine steel case hardened ones stand up to the work better. Two upright stops, (one at each side) determine the length of the shell. The pin in the centre of the die determines the size of the fuse hole. A, B, C and D are gauged (see Fig. 9).

FIG. 10.

Finish Fuse Hole and Inside Contour

10th operation, Fig. 10. A turret lathe equipped with a collet chuck as in operation 5 but with the nose end protruding. The first tool rough bores and faces to length, it carries a stop which strikes the bottom of the bore. The second tool recesses the rear part of the fuse hole (rear of threads). The third tool (forming cutter) bores the inside contour, a roller at the end of the cutter in line with same brings this cut in line with the bore. The fourth tool, a rose reamer, reams the hole over the threaded portion. The fifth tool, a collapsible tap, is next run in. A, B, C, D, E, F and G are gauged (see Fig. 10).

Form Outside Contour

11th Operation, Fig. 11.—The shell is held by its base diameter in a collet chuck and a screw centre in the nose end supported by the tail stock centre. The profiling tool (a flat forming cutter) is held in a box tool holder. A stop prevents the operator from making the shell too small at the nose. A and form of nose are gauged (see Fig. 11).

Grind Body and Shoulder

12th Operation.—A grinder is employed for this operation. A, B and C are gauged (see Fig. 12).

FIG. 11.

FIG. 12.

Finish Face Base

14th Operation, Fig. 13.—The shell is held as in operation 5, the inside of the base being set against a stop as in that operation. A stop on the lathe bed is in line with this stop. By means of blocks, as explained in operation 13, the operator has a fixed thickness to work to. The carriage is brought up to this stop and the tool then fed across the base. A is gauged and B checked (see Fig. 13).

Weigh

13th Operation.—By means of an ordinary pair of scales or special basket scales. A table of weights calculated from a finished shell is tabulated in accordance with each thirty-second of an inch across the base of the shell, between the high and low limits. The amount of stock to be removed to bring the shell within the required weight is stamped on the base, i.e., 1-32, 2-32, etc. Any shells over weight must be returned to operation 10 and have stock removed from the inside contour by means of a similar contour tool (third tool, operation 10) with a cutter having a larger radius, care being taken not to make a thin wall. By taking a trial shell through to the last operation, the desired weights at this stage can be ascertained.

FIG. 13.

Check Weight

15th Operation.—Scales similar to those used in operation 13.

Groove and Knurl Barrel Recess and Chamfer, Also Chamfer Base

16th Operation, see Fig. 14.—Engine lathe or special open end machine having a four-way tool holder. First tool grooves, leaving a raised portion in the centre of the groove. The second tool chamfers the back edge of the groove. The third tool chamfers the base. Stops are used to determine the diameters and the proper distance from the base. A, B, C, D, E, F and G are gauged (see Fig. 14).

FIG. 14.

FIG. 15.

Groove Base

17th Operation, Fig. 15.—The shell is held as in operation 5, a similar stop being used inside the bore. A flat forming tool held in a block tool holder is used. A stop on the carriage fixes the depth of cut. A, B, C and the form of groove are gauged (see Fig. 15).

Wash and Sand Blast

18th Operation.—Special machines are now on the market, the use of which saves time and insures first class results.

Preliminary Shop Inspection

19th Operation.—The shells are arranged according to serial numbers and then submitted. The following gauges are used to check the shell: high body ring gauge; low body ring gauge; high base ring gauge; low base ring gauge; snap gauge high and low diameter driving band recess; snap gauge high and low diameter of knurling; width of driving band recess; high and low distance from base (combination gauge); length and angle of driving band recess chamfer; length and angle of base chamfer; form of base groove; high and low diameter of base groove; calliper gauge for thickness of wall; calliper gauge for thickness of base.

FIG. 16.

Preliminary government inspection immediately follows the foregoing.

Applying Base Cover Plates

20th Operation.—The shell is held in a special hand champ with lead pad at bottom for nose of shell to rest on, its base being upwards. The lead plate is placed over the base and the brass disc, with its flange in the groove, is placed over it and planed into the base groove.

Apply Driving Band

21st Operation, Fig. 16.—The band is applied cold by means of a special banding press. A is gauged occasionally (see Fig. 16).

Stamping

22nd Operation.—The required stamping is done just above the driving band. The shell is placed in a groove in the bench. The stamps are held in a special holder.

FIG. 17.

Mill Slot in Nose

23rd Operation, Fig. 17.—The shell is held in two vee blocks and fed into the milling cutter. Both dimension and form of slot are gauged, see Fig. 17.

Hand Tap and Reseat

24th Operation.—The shell is held as in operation 20, but with its nose upwards. A hand tap is used to insure a clean smooth thread and also for sizing purposes. A rose reamer is employed to smooth the angle of the fuse hole. Its shank is threaded at the bottom to suit the threads in nose of shell; at the upper end (above the reamer) are two threaded collars to keep the reamer against the shell. A combination gauge for the threads and angle of seat is used.

Wash and Clean

25th Operation.—Special washing machine as used in operation 18.

Varnish and Bake

26th Operation.—The shell is varnished while rotating on belt-driven rollers, a varnish spray gun being used. The shells are then placed nose downwards in a rack mounted on rollers and run into a gas oven.

FIG. 18.

Turn Bevel

27th Operation, Fig. 18.—The shell is held as in operation 5. A special open end machine or engine lathe is used. At the forward end of the carriage is a block tool holder which holds the two trimming tools (operated separately by hand screws) which turn the band to the proper width. The holder which supports the two shaving tools (roughing and finishing) is mounted at the back of the carriage and passes under the shell. A, B, C and form of band are gauged (see Fig. 18). As no cutting compound is used the shell does not become dirty again. This operation is placed last as the driving barrel is easily damaged.

Final Shop Inspection

27th Operation.—The shells are now submitted for final inspection. It is again weighed and the following gauges used: ring gauge high base; profile of nose; concentricity (cylinder) gauge.

Final government inspection concludes the work on the shell which is most directly connected with machine shop methods.

MAN POWER BIGGEST FACTOR IN INDUSTRY

WHAT is going to happen if the output of steel is not increased? The fate of the war depends largely upon the steel production of the United States, and the out-turn is being seriously retarded by lack of fuel, iron, transportation facilities and labor.

The seat of the trouble which is hampering production at this time is labor. There are not enough men to man the steel plants. There is also not sufficient fuel to operate them for the same reason, and the facilities of transportation have proven entirely inadequate to the extra strain. The consequence has been that production instead of increasing is declining, and the out-turn of some mills is reported to have been reduced to 50 per cent. of normal capacity.

As for iron, the outlook is still more serious. The lack of man power is holding up production of ore, of fuel, and consequently of iron and steel. In the Eastern market recently there were inquiries for upward of 25,000 tons of basic and foundry iron. The great bulk of this demand must disappear because there is nothing with which to satisfy it. It is estimated that of the tonnage asked for probably not more than 5,000 tons will be found available for distribution.

The inquiries are for large and small lots for delivery from now to next July. The furnaces are also growing cautious about extending their engagements for next year, as they are already well sold up and behind on their present contracts for the year. Steel makers and foundry men are clamoring for iron all over the country, and the market has probably never before been subjected to such a combing process with so little tangible result. It is well for industry in general that the price is fixed or the market would undoubtedly be thrown into an unprecedented state of panic.

WASHINGTON DISTRIBUTES WAR ORDERS

ORDNANCE Bureau has distributed orders for about five hundred thousand 200-millimeter and seven hundred and fifty thousand 155-millimeter shells. Contracts for forgings for nine hundred thousand 240-millimeter projectiles have also been awarded, and contracts for machining these will probably be concluded within a few days. Further contracts for guns and gun forgings have also been let.

The order for seven hundred and fifty thousand 155-millimeter went to American Brake Shoe & Foundry Co., which also is expected to secure a contract for about half the 240-millimeter shells to be placed. American Car & Foundry Co. will also get contracts for 240-millimeter shells.

The half million 200-millimeter shells have been awarded to Westinghouse Electric Co. and McMyler-Interstate Co. of Cleveland.

Orders for forgings for the 155-millimeter, 200-millimeter and 240-millimeter shells were divided among following companies: Bethlehem Steel, Midvale Steel, Pollack Steel, American Steel Foundries, Taylor-Wharton Steel & Iron, Curtis & Co., Whitaker Glesner Co., Carnegie Steel, Pennsylvania Steel, American Rolling Mills, and Cape Ann Anchor Works.

Some of these concerns already have substantial orders for guns or shells. Bethlehem and Midvale, it is known, have a record-breaking volume of business from the United States Government, most of it of this character, but details of the contracts are being withheld. American Brake Shoe has a contract for three thousand 155-millimeter howitzers, closed August 24, and is now actually producing these guns. Westinghouse Electric has a contract for 1,800,000 six-inch shells (practically the same size as the 155-millimeter) for Great Britain and for 75-millimeter shells for this Government.

Pollack Steel has contracts for forgings for 1,000,000 British six-inch shells and for gun forgings and battleships and destroyer forgings.

It is estimated that the ordnance department has placed total contracts since beginning of war for 60,000,000 shells of different sizes, of which about 29,000,000 were 75-millimeter, and for over 20,000 guns from 75-millimeter up.

TWENTY-FIRST ANNUAL MEETING OF NATIONAL FOUNDERS' ASSOCIATION

ON the occasion of its twenty-first annual meeting, held at the Hotel Astor, New York, Nov. 14 and 15, the National Founders' Association demonstrated as far as possible in a meeting of this nature the loyalty and patriotism of its members. A new high record was set for attendance, this event being largely influenced by the great amount of labor disturbance throughout the United States. The apprehension felt by the members regarding results likely to arise from the attitude of labor unions was strongly evidenced by the president, William H. Barr, who stated that national efficiency and prosperity rested upon that foundation of industrial equality and liberty known as the open shop, and he further insisted that in time of war the 8-hour day is an economic waste and a grave menace.

Increased Output With Reduced Labor

The question of maintaining normal production of castings despite reduced labor facilities was discussed to a large extent. The opinion was expressed that jobbing founders are not producing in excess of 50 per cent. of their capacity, and president Barr emphasized the patriotic duty of jobbing casting manufacturers to maintain their normal production in spite of the labor shortage.

The results obtained through the installation of moulding machines and similar labor-saving equipment were convincingly shown in a series of motion pictures taken in various progressive plants in the United States and Canada. Moulding, pouring and shaking-out work when performed with suitable equipment had yielded increased output up to four and fivefold, and in some of the shops shown the skilled labor had been replaced entirely by handymen. Piecework payment prevailed and combined with the increased output, had resulted in greatly enhanced wages. Operations at the following plants were shown by the pictures: King Sewing Maching Co., Buffalo; Buick foundry of the General Motors Co., Flint, Mich.; Eddy Valve Co., Waterford, Conn.; McClary Mfg. Co., London, Ont., and the Lumen Bearing Co., Buffalo. In connection with the latter plant it was stated that the employes are now averaging an output of 1,108 pounds of castings each, of an average weight of less than three pounds per casting.

Officers and Council

New officers of the N. F. A. are: President, William H. Barr, Lumen Bearing Co., Buffalo; Vice-President, Samuel L. Moore, Moore Bros. Co., Elizabeth, N.J.; Secretary, J. M. Taylor, Chicago; Commissioner, A. E. McClintock, Chicago.

The following members of the seventh district committee were chosen: George W. Watts, Canada Foundry Co., Ltd., Toronto, Ont.; A. R. Goldie, Goldie McCulloch Co., Ltd., Galt, Ont.; H. Cockshutt, Cockshutt Plow Co., Brantford, Ont.; J. C. Russell, John McDougall, Caledonian Iron Works Co., Ltd., Montreal, Que.; W. M. Gartshore, McClary Mfg. Co., London, Ont.

MORE FUEL OIL FOR STEAMERS

AN important change which has been comparatively lost sight of owing to the stress of war conditions is the increasing use of crude oil as fuel for steamships. Without a great deal of publicity having been given to the fact, a not unimportant portion of the American merchant marine has been turned into oil burners. The navies of the world, of course, have been using oil as fuel much longer than the merchant services. In this connection it may be noted that at a recent conference held at Washington between representatives of the American and British governments. Standard Oil officials and the Shipping Board, an ample supply of oil for the British navy was assured.

The chief advantages claimed for oil as fuel are a saving of bunker space in the ship and a saving of dead-weight. Up to comparatively recent years the drawback has been the price of oil, but with the unprecedented enhancement in the price of coal which war conditions have brought with them the economic opportunity to use oil has presented itself. Speaking generally the increase in the Texan, Mexican, and Californian oil supply which has taken place during recent years has made possible a greater use of oil for generation of steam on ships. Hitherto oil was usually too valuable to be used in ships furnaces.

Particularly on the Pacific Coast and in trade with the Orient has the war promoted the use of oil as fuel on ships, the source of supply in the Gulf region and California being relatively near at hand.

Five steamers now in course of construction for the New York- Valparaiso service are to be oil burners. Eighty per cent. of the Standard Oil steamers now afloat are equipped as oil burners. The Southern Pacific Railway, which has oil fields of its own, has been the leader in this country in the use of oil fuel for locomotive engines. In 1915 the company had 1,927 oil-burning locomotives out of a total of 2,046 engines. The Southern Pacific is also using oil as fuel for its steamers to a very considerable extent.

The Luckenbach Steamship Co. has a couple of oil-burning steamers. There was launched last month at the yards of the Fore River Shipbuilding Co., Quincy, Mass., a large oil-burning freighter of 10,000 tons dead-weight intended originally for the Luckenbach Steamship Co., but now taken over by the Government. The fuel oil is carried in the double bottom and in the forward and after peak tanks.

The Atlantic, Gulf & West Indies Steamship Lines have seven or eight oil-burners. Most of the newer ships have been equipped to use liquid fuel, the policy being to build all new ships with facilities for the use of either coal or oil. The Munson Line has two or three oil burners of 7,500 tons dead-weight, and other American companies have one or more vessels equipped in this way, as for instance the United Fruit Co. Some of the Cunarders will be oil-burning ships.

RECENT DEVELOPMENTS IN POTASH PRODUCTION

THE influence which it is possible for the cement and iron industries to exert on the production of potash is of considerable importance at this time, and the possibility of this influence increasing in the future is the belief of Richard K. Meade, expressed in an article in the "Manufacturers' Record." The necessity for development work on this continent has been growing more urgent with the continuance of the war, some idea of the urgency being conveyed by the statement that the imports of pure potash from Germany before the war amounted to 250,000 tons, while 10,000 tons only were produced in the United States last year, as estimated by the Geological Survey.

Recent reports in Canada indicated the probability of production being increased by suitable treatment of feldspar in connection with cement manufacture. It seems, however, that the loss of potash by volatilization from rotary cement kilns was pointed out as far back as 1903, and that from blast furnaces still earlier, but before 1914 nothing was done to collect the substance from either source.

Some ten years ago a dispute arose between the orange growers in South California and the cement mills over the question of the damage caused by the dust from the mills being deposited on the fruit trees, and to settle the matter the Riverside Portland Cement Company installed a process for precipitating the dust by the Cottrell electrical system. This process not only proved efficient as a dust-catching device, but also collected the potash with the dust. Most of the potash being water-soluble, it can be dissolved out of the dust by leaching with water. Before the war the raw materials used at Riverside were low in potash, and hence the amount volatilized was small, but after the outbreak of war the company found they could increase the output of potash from their kilns by the aid of feldspar, which can be used without injury to the cement. They also found that mixing fluorspar with the raw materials increased the amount of potash volatilized to 90 per cent. of the amount contained in the raw materials, as against 50 per cent. volatilized under usual conditions. They next extracted the potash from the dust, and by crystallization obtained a potash salt containing at least 35 per cent. of potash. The crust which collects in the stacks of the rotary cement kilns contains from 6 to 12 per cent. of potash, and of this large quantities have been sold to the fertilizer companies since 1914.

In the summer of last year the Security Cement and Lime Company put the Cottrell process into operation in order to catch all their kiln dust. They found that the addition of salt to their raw materials increased the yield of potash, and at present they are obtaining about 20 tons of dust a day, averaging 10 per cent. of water-soluble potash. The Santa Cruz Portland Cement Company are recovering 700 lb. of potash daily from their kilns by a process of their own, and a number of other cement companies are installing or have installed Cottrell plant. When all these plants are in operation Mr. Meade estimates that they will yield about 10,000 tons of potash annually, and this amount, he states, could be very greatly increased by using feldspar as a raw material.

As to potash from blast furnaces, the only iron company in America, so far as he is aware, selling potash at present is the Bethlehem Steel Company. Up to the present only the dust which can be collected by means already at hand has been sold, the amount being estimated at about 4 per cent. of the total potash liberated; but the chemist of the company believes that apparatus could easily be installed to catch at least 50 per cent. of the potash now lost, and that the apparatus, so far from interfering with the operation of the plant, would benefit it through the better cleaning of the gas for the engines. It is estimated that of the potash volatilized in the blast furnaces the amount recoverable will average at least 10 lb. per ton of pig iron, so that with an annual production of 25,000,000 tons of pig iron the blast furnaces of the United States would produce, say, 125,000 tons of potash.

Heat Treating and Annealing Furnace with Oil Fuel Equipment

Staff Article

Despite the variety of equipment now available for all lines of manufacture, and the degree of perfection attained in the design and production thereof, circumstances occasionally arise where individual requirements influence the production of articles more or less at variance with standard types. The furnace described herewith is an apt example of personal initiative combined with adaptation of stock equipment.

OPPORTUNITIES for obtaining first hand experience in furnaces burning coal, oil and gas, have been particularly numerous since the shell industry came to this country. Previous to that time there were, of course, many plants which employed furnaces on a large scale—steel works, enamelling plants, and specialized factories of various kinds. The great majority of machine shop establishments, however, had their requirements capably met by small and medium sized gas fired furnaces, and in some cases coke fired furnaces were used.

Features of Fuels

The beginning of munitions making resulted in a widespread activity, mostly of an experimental nature at the start, which embraced the three fuels mentioned, and finally resulted, in probably the majority of cases, in the adoption of oil fuel. The less general availability of gas militated against its use except in the larger industrial centres, where its convenience, cleanliness, and the comparatively greater familiarity of most workmen with its operation influenced its frequent adoption. For use on a large scale the cost is sufficiently high to compel consideration being given other fuels.

Coal Displaced

With careful manipulation and suitable furnace construction, anthracite coal has in one particular instance given very satisfactory results but here again the installation was of medium size and under more or less constant operation. Such conditions, however, did not obtain in the case of the plant where the furnace shown in the accompanying illustrations is installed. Previous to recent reconstruction, this furnace was of the old side fired type, using soft coal. The fire chamber extended along the right hand side where the oil burners are now located, giving a long narrow grate, difficult to fire properly, and increasing the width of the furnace by about 50 per cent. over that shown. In addition, a brick stack was carried up through the floor above. The lighting up of such a furnace was never a pleasant proposition. The amount of smoke around the rooom till the draft caught on properly, the length of time heating up to a working temperature and the unavoidable variation in temperature, all combined to render it unsuited for the work on which it was employed by the Radcliff Saw Mfg. Co., of Toronto, and an investigation of numerous oil fired furnaces in the surrounding district convinced them of the merits of that fuel.

FIG. 1. GENERAL EXTERIOR VIEW OF FURNACE. OIL TANK IN FOREGROUND AND PUMPING EQUIPMENT AT BACK.

Features of Design

While the general principles of oil firing are more or less similar, there are opportunities for the exercise of individual judgment, both in the manner of consuming the fuel and in the arrangement of combustion chamber, baffles and flues which exercise an important influence over the distribution and control of temperature. The design of the furnace proper is the work of the company's superintendent, J. C. Hills, while the fuel burning apparatus is Tate-Jones & Co.'s low pressure system. Owing to cost of materials, etc., the foundation and brick-work were executed by local furnace builders, the burners and pumping equipment being erected by the Radcliff Co.

The general appearance of the exterior is shown in Fig. 1. A cross section is shown in Fig. 2, while Figs. 3, 4 and 5 are respectively a part longitudinal cross section and elevation, sectional view of burner, and view of pumping equipment. The hearth is 7 ft. 2 in. wide by 11 ft. 2 in. long, and is composed of tiles 18 in. by 13 in. by 3 in. laid with their length across the furnace, and supported by eight cross walls. These cross walls are of standard size fire-brick spaced as shown, and a burner set opposite each alternate one so that the flame, after striking on the large renewable baffle brick (shown cross hatched), percolates through the spaces into

FIG. 2. CROSS SECTION OF FURNACE SHOWING ARRANGEMENT OF BURNER PASSAGE AND BAFFLE BLOCK

the adjacent [illegible] nd meets the hot gases from the next burner.

Action of Gases

The hot gases thus distributed pass across to the opposite side of the combustion chamber under the influence of the draft from the four flues shown. It will be noticed that the perforations in the cross walls extend into the flue area and thus allow it to draw on the outer cross passages. On ascending into upper or work chamber, the gases flow across the surface of the arch and make their exit by four similar flues in the right hand wall, each flue having a separate passage to atmosphere with individual dampers. See cross section, Fig. 2.

FIG. 3. PART SECTION AND ELEVATION SHOWING PERFORATED SUPPORTING WALLS UNDER HEARTH.

Low-Pressure System

The low-pressure system of burners is so termed because of the small air pressure required for operation. Those installed are Tate-Jones L-1 type, operating with air at approximately 2 lbs. pressure per sq. in., while the fuel is supplied at a pressure of 20 lbs. per sq. in. As shown in sketch Fig. 4, the fuel is supplied through the ⅜ in. pipe which enters the 2 in. air pipe near the ground, and extends upward to an internal nozzle, its exit from which is controlled by a needle valve adjusted by a star wheel.

This internal nozzle is movable bodily to or from the mouth of the burner casing by means of a threaded bushing having a suitable handle, which therefore allows the proportion of air to be increased or diminished without altering the fuel valve setting, the inside fuel pipe readily springing the maximum distance traveled by the bushing in adjusting the air supply.

FIG. 4. SECTION OF BURNER SHOWING INTERNAL OIL PIPE AND NEEDLE VAVLE.

Auxiliary Air Supply

The openings in the wall through which the fuel and air pass to the combustion chamber are of enlarged conical section for one-third of the distance, when they are joined by extra air passages from below, so arranged as to surround the ingoing streams of air and oil with an additional body of air, the entire product then passing through the remaining straight third of the wall and impinging on the baffle blocks previously referred to. The resulting combustion is extremely good, the complete atomisation of the fuel being assured, while the auxiliary air flues described reduce the possibility of danger when a flare-back occurs as may happen once in a great while through careless adjustment.

The tendency of the heat to rise gives every chance for the hearth to get well saturated at high temperature and thus prevents undue cooling when the furnace is loaded up; the heating is also correspondingly more rapid. During operation the roof arch is swept by the hotter gases and the resulting radiation of heat down on to the work gives excellent uniformity of temperature throughout.

Individual Dampers

A simple type of slide damper is fitted in each discharge flue and thus permits the heat to be distributed or localized according to the shape and size of work being heated. The combustion gases pass upward to a large hood, Fig. 1, whence they escape to atmosphere through a small steel pipe which replaced the former massive brick shaft.

Toward the back of Fig. 1 is seen the pumping equipment which is remarkable for its compact arrangement. Fig. 5 shows this in more detail. Just below the lower right hand corner the oil storage tank is sunk in the ground, the oil being drawn therefrom and pumped to the fuel burner by a small De Laval rotary pump which maintains a steady pressure of 20 lbs. per sq. in. An overflow relief valve on the discharge side prevents damage or trouble when all of the burners are shut off suddenly. At the far end of the bench is a No. 4 P.H. and F.M. Roots positive pressure blower

FIG. 5. COMPACT ARRANGEMENT OF MOTOR, PRESSURE BLOWER AND OIL FUEL PUMP FOR FURNACE

supplying air through a 2-in. pipe at 2 lbs. per sq. in. This air pipe is led into a passage formed in the furnace foundation and is thus considerably preheated before mixing with the fuel.

A three-phase 25-cycle Chapman and Walker motor is located between the two pumps, driving them by counter-shaft as shown.

Quenching Facilities

The work for which the furnace was originally built consists of hardening saws thus necessitating a low wide chamber. The quenching bath is shown in Fig. 1, being 9 ft. by 18 in. by 10 ft. deep sunk in the floor below the operator. Suitable overhead tackle enables the saw to be held vertically and revolved at a proper speed while being quenched. A Taylor Instrument Co.'s pyrometer outfit reading to 1,800 deg. F. covers the range of all of the work at present. Considerable special work has been done, however, such as heat treating aeroplane axles, several being in the foreground of Fig. 1, while the annealing of special sheet steel stock is handled to great advantage, the fuel system enabling the composition of the gases to be kept free from oxidizing effects on the metal.

THE COST OF LEAKING STEAM

By N. G. Near.

TO determine the cost of leaking steam with any degree of accuracy we must know at least four factors: (1) The number of pounds of steam evaporated by 1 lb. of coal; the greater this is the less is the cost of leaky pipes, other conditions being the same; (2) the total area of leakage; (3) the absolute steam presure, which is equal to the gauge pressure, plus the atmospheric pressure; at sea level this is usually reckoned as gauge pressure, in pounds per square inch, plus 14.7; and (4) the cost of coal per ton of 2,000 lbs.

For example, how much money is lost every 10 hours under the following conditions: Nine lbs. of steam are generated by each pound of coal. The total area of leakage is ¼ sq. in. The gauge pressure is 105 lbs. per square inch (making the absolute pressure very close to 105 + 14.7 = 120 lbs. per square inch). The cost of coal is $3.50 per ton.

Referring now to the chart, lay a straightedge across the chart three times as indicated by the dotted lines and the problem is solved. Run the first line from the 9 (column A) through the 120

(column C) and locate the intersection in column E. Run the second line from that point of intersection to the 0.5 (column B) and locate the intersection in column C. From that point of intersection run the third line to the $3.50 (column E) and the answer is found at the intersection with column D. The answer is $6 loss per 10 hours.

In case it is found that the total leakage area is less than shown in column B, the chart may be used by shifting decimal points. For example, if, in the above problem, the leakage area had been 0.05 instead of 0.5 sq. in. the answer would be 60 cents instead of $6 per 10-hour day.

When using the chart, the steps must follow in the order shown and above described. First line, A to E through C. Second line, E to B. Third line, C to E.

The range of the chart is great enough to easily handle any ordinary problem.

BRONZE FINISHED BUTTONS

ARMY buttons are made from solid copper with a brass screw back fastener. The finish is a rich dark brown tone without lustre. Navy buttons are made from brass and finished in ormolu gold by a combination of mercury or fire gilding and electro-gilding.

In producing the military bronze finish, unless the button and fastener are made entirely of copper, they must be copper-plated, says Charles H. Proctor in "The Metal Industry." After plating the buttons are washed and dried. A saturated solution of copper nitrate is prepared by dissolving all the copper nitrate possible in water heated to 180 degrees. The buttons are then placed in a tumbling barrel, revolved at from 4 to 6 revolutions per minute, and a sufficient amount of the copper nitrate solution applied so the buttons will be covered uniformly by rotation. An excess of the copper nitrate should be avoided or the buttons will come out patchy in the final finish. After tumbling for a few minutes the buttons will have a dark stained appearance.

Remove the buttons and place upon sieve pans made from iron wire mesh, then heat the buttons to a temperature of 700 or 800 degrees in a closed retort with provisions for carrying off the smoke fumes. After the smoke fumes have all been eliminated the heating operation is finished and as a result the copper nitrate is converted into brownish black oxide of copper, which proves to be a permanent finish.

It is a whole lot easier to tell how a thing ought to have been done than to tell how it ought to be done—and there still remains the difficulty of doing it.

AN alloy that has proved very satisfactory for ships' propellers is turbadium bronze. This material has a tensile strength of about 35/42 tons with an elongation of 14/20 per cent. on a 2-in. test piece, and it is not appreciably corroded by seawater. Its composition is, approximately, copper 48 per cent., zinc 46.45, tin 9.5, lead 0.1, iron 1, aluminum 0.2, manganese 1.75, nickel 2.

The United States super-dreadnought Tennessee will be driven by four alternating-current motors, one to each propeller shaft, supplied by current at 3,400 volts from two 13,500 horse-power turbo-generators. The motors will be wound for both 36 poles and 24 poles, operating on the former as squirrel-cage machines and on the latter as wound-rotor machines.

To deaden the noise from trucks rumbling over a concrete floor, a factory has successfully used a heavy tar paper pasted to the floor by paint. The method of application is as follows: The floor to be protected is first given one coating of grey cement paint. On the following day, when the paint is thoroughly dry, a second coat is applied. At the same time one side of a five-ply tar paper is painted and when both paper and floor are still wet the paper is carefully laid, wet side down, on the floor and rolled with either a roller or wide tired truck until all signs of air pockets beneath the paper disappear. The surface seems to improve with age and very effectively reduces upkeep to an extremely low cost.

PRODUCTION METHODS AND DEVICES

A Department for the Interchange and Distribution of Shop and Office Data and Ideas Evolved from Actual Practical Application and Experience

SPECIAL GRINDING ATTACHMENT

By J. H. R.

THE maintenance of forming cutters for boring operations has given many manufacturers considerable trouble, particularly in production of shells, the machining of which has necessitated the use of large numbers of these flat cutters. Much of the difficulty experienced has been due to inability to maintain the desired shape and dimensions of the tool, owing to the rapid wear of the cutting edge.

The more efficient method of grinding boring cutters is to give an eccentric or convex shape to the clearance face, as shown to the right of Fig. 1. By this method it is possible to grind for ample top rake and yet retain a cutting angle that will give sufficient strength and metal to resist the pressure or the heat generated by the cut. It can be seen that the "cutting" qualities of the tool to

FIG. 1. ILLUSTRATING PRINCIPLE OF GRINDING FLAT BORING CUTTERS.

General practice in grinding this type of cutter is to use a wheel that cuts on its outer circumference, as shown to the left of Fig. 1, leaving the side with a concave appearance. In order to obtain sufficient clearance at the heel of the cutter it is necessary to grind in such a manner that the actual clearance angle is often very pronounced, as indicated by the angle C. If this clearance was from a diametrical point on the cutter, the cutting qualities of the tool would not be greatly affected, but without top rake the point D has a scraping rather than a cutting tendency, owing to the edge being one-half the width of the blade above the center line. To give the proper rake to this tool the cutting angle must be reduced, and in doing so the effectiveness of the edge is further destroyed, owing to the increased possibility of chipping or over-heating.

the right are much better than those of the other. The cutting angles C and I are about the same but the advantages of the eccentric ground tool are readily appreciated by a glance at the cutting edges D and J.

Application of Principle

Fig. 2 illustrates the method adopted for grinding shell boring cutters in a plant known to the writer. Discarded wheels from a Landis grinding machine were utilized for this purpose, these wheels having an interior diameter of about 5 in. When the Landis machine is through with these wheels the outer diameter has been reduced to about 8 in., so that they were readily adapted for their new duties. The fixture for holding these wheels, so as to provide an interior grinding surface, consists of a box casting A threaded to fit the nose of the spindle, and with sufficient length to allow the longest cutter to pass the grinding wheel. The wheel B is dressed to fit the recess in A and is afterwards clamped by the nut C. The bearings of the lathe upon which these grinders were used were redesigned somewhat, and the machine belted to give a surface cutting speed of about 5,000 ft. per min.

In order to get the desired eccentric clearance on the cutter, the turret was raised equal to half the thickness of the blade, and one of the holes bored to fit the shank F, so that when the turret was returned to its proper position the upper face G of the forming cutter was in the same horizontal plane as the lathe spindle, but the center line D-E of the cutter arbor was lower by half the thickness of the blade. Locating points H were provided in the shank to determine the proper position for grinding either side of the cutter. Facilities were also provided to swing and lock the turret at a slight angle to grind the tapering end of the forming cutter.

FIG. 2. DEVICE FOR APPLYING PRINCIPLE SHOWN IN FIG. 1.

SAFETY-COLLAR FOR EXPOSED SHAFT ENDS

By J. Wright.

A VERY suitable protective means for preventing workmen from getting caught on the exposed ends of overhead shafting is the end safety-collar, shown in sketch. It consists of an inner collar having two headless screws for fastening this to the shaft. A loose fitting outer collar is placed over this. The inner collar has a square groove near the edge, cut reasonably deep, and wide enough so that the two pins fastened in the outer collar will hold it in position, while allowing the shaft and inner collar to revolve freely.

SAFETY COLLAR FOR EXPOSED SHAFT ENDS

The shaft hole in the inner collar can be made large enough so it can be used on shafts of different diameters, it being only necessary to adjust the screws, and for this purpose a hole is made in the outer collar to insert a screw-driver.

It is readily seen that pressure on the outer collar from a workman's arm or sleeve will cause it to stop instantly, preventing damage such as would be done by the bare end of a revolving shaft.

MANUFACTURE OF HARDENED THREAD GAUGES—IV.*

By G. Doorakkers.

IT does not require many special checks for inspecting male screw gauges. All dimensions can be ascertained by using a micrometer. The outside or major diameter can be taken direct. The pitch diameter is taken over one or three wires again by using a micrometer. The minor or core diameter can be taken with a micrometer by the aid of the attachment shown in Fig. 22. For verifying male screw gauges that have been put into use it is an advantage to have a final full thread female check, which has, of course, to be inspected for all the dimensions like a female gauge. From practice it will be found satisfactory to allow a shrinkage and lapping allowance of .001 for medium and large gauges and .0005 for small gauges.

Checks for Female Gauges

It requires several checks to test a female screw gauge effectively. (1) Check for minor diameter; (2) check for major diameter; (3) check for pitch diameter; (4) check for full thread.

Check for minor diameter.—The minor diameter can be measured with a plain plug gauge with two diameters, a "go" and a "not go" diameter. The "go" diameter is made the required size of the gauge and the "not go" diameter one-

FIG. 27.

half thousands over the required size. A lead of 2 deg. included angle is ground about ¼ in. up on both diameters.

As hardened female gauges require lapping out, and have also a tendency to open out slightly in hardening, we require two gauges for every size, a turning gauge and a lapping gauge. It has been found good practice to allow .001 in. between the turning size and the lapping size for medium-sized gauges.

Fig. 27 represents the checks for the minor diameters.

The material is mild steel, which is carbonized hardened and ground.

Example.—The diameters for the checks for minor diameter for a female gauge 1.998 = 14 R.H. are—

Minimum diameter of turning check = F — 1.28064 P — .001 = 1.998 — .09148 — .001 = 1.90552.

Maximum diameter of turning check = F — 1.28064 P — .0005 = 1.998 — .09148 — .0005 = 1.90602.

Minimum diameter of lapping check = F — 1.28064 P = 1.998 — .09148 = 1.90652.

Maximum diameter of lapping check = F — 1.28064 P + .0005 = 1.998 — .09148 + .0005 = 1.90702.

Checks for major diameter.—The major diameter of a female screw gauge must be measured with a check that touches the radius only and is free everywhere else. The flanks of the thread are cut with a sharp pointed tool with an included angle of 50 deg. and the radius is cut with a female master tool. The gauges are made of mild steel and kept soft all over except on the thread, where the carbon is left in so that the thread will be hard.

Fig. 28 shows two types of these checks, the principle of which is the same, only Type 1 is for the larger diameters and Type 2 for the smaller diameters.

The hole H in Type 1 is made to suit a handle shown in Fig. 29. Dimension G for both types is turned under the bottom diameter of the thread. Dimension W is in both cases ½-in. + 8 P. These checks are again required for turning and lapping sizes. Assume F the finished major diameter of the female screw gauge, then:

For the turning check—
A = F — .001 in.
B = F + 2 x — .001.
C = F — .0005.
D = F + 2 x — .0005.

For the lapping check—
A = F.
B = F + 2 x.
C = F + .0005.
D = F + 2 x + .0005.

The value of x is calculated as follows:—

In Fig. 30, in triangle D B E:
D B = ½ P.

$$DE = \frac{DB}{\tan 25 \text{ deg.}} = \frac{P}{2 \tan 25 \text{ deg.}}$$

In triangle A B C:
A C = R.

$$AB = \frac{R}{\sin 25 \text{ deg.}}$$

$$DG = AB - R = \frac{R}{\sin 25 \text{ deg.}} - R.$$

$$EG = DE - DG = \frac{P}{2 \tan 25 \text{ deg.}} - \frac{R}{\sin 25 \text{ deg.}} + R.$$

In triangle E M F:

$$ME = \frac{FM}{\sin 25 \text{ deg.}} = \frac{d}{2 \sin 25 \text{ deg.}}$$

$$EH = EM + MH = \frac{d}{2 \sin 25 \text{ deg.}} + \frac{d}{2}.$$

$$X = EH - EG = \frac{d}{2} - \frac{1}{\sin 25 \text{ deg.}} + 1$$

FIG. 29

$$- \frac{P}{2 \tan 25 \text{ deg.}} - \frac{R}{\sin 25 \text{ deg.}} + R.$$

Example.—The diameters for the checks for major diameter for a female gauge 1.998 = 14 R.H. are:—

Diameter wire d = .040.

$$X = \frac{.020}{\sin 25 \text{ deg.}} + .020 - \frac{.035714}{\tan 25 \text{ deg.}} - \frac{.0098}{\sin 25 \text{ deg.}} + .0098$$

= .067324 — .063200 = .004124.

For the turning check,
A = 1.998 — .001 = 1.997.
B = 1.998 + .0082 — .001 = 2.0052.
C = 1.998 — .0005 = 1.9975.
D = 1.998 + .0082 — .0005 = 2.0057.

For the lapping check,
A = 1.998 = 1.998.
B = 1.998 + .0082 = 2.0062.
C = 1.998 + .0005 = 1.9985.
D = 1.998 + .0082 + .0005 = 2.0067.

FIG. 30

The 50 deg. sharp pointed tool is ground on the fixture shown in Fig. 3 by using a packing piece or a bush of a certain thickness between the tool and the bottom pegs. The thickness of the bush or the packing piece to obtain a 50 deg. angle is calculated as follows:—In Fig. 31 A B = .188. The new angle of inclination with the vertical is 65 deg. B D is a line drawn parallel with A C. B D therefore makes an angle of 2 deg. 30 min. with the line joining the centres of the pegs. D C = A B. In triangle B D E: D E = 2.624 × sin 2 deg. 30 min. = .114457. E C = D C + D E = .188 + .114457 = .302457.

*Contributed to a recent number of "The Engineer." No. 3 appeared Nov. 22.

FIG 28.

The thickness of the bush or the packing piece is therefore .302457 — .188 = .114457.

The operations on type 1 are as follows:—(1) Cut off. (2) Grind off tit. (3) Centre both ends. (4) Turn shank. (5) Turn diameter thread. (6) Rough thread (to about two-thirds of depth). (7) Carbonising. (8) Heat up to 800 deg. and cool four times in water. (9) Anneal in charcoal. (10) Bore hole. (11) Cut off boss. (12) Face off one side (face to be smooth). (13) Face off to width (dead size, see operation 29). (14) Turn groove in middle. (15) Grind diameter thread maximum side (.0025 over size). (16) Grind diameter thread minimum side (.0025 over size). (17) Rough screw maximum end with 50 deg. sharp pointed tool. (18) Rough screw minimum end with 50 deg. sharp pointed

FIG. 31

tool. (19) Finish screw maximum end with 50 deg. sharp pointed tool. (20) Finish screw minimum end with 50 deg. sharp pointed tool. (21) Radius top maximum end (allow one thousandth for lapping). (22) Radius top minimum end (allow one thousandth for lapping). (23) Mill slot minimum end. (24) Turn away part thread. (25) Burring and marking. (26) Heat up to 800 deg. and harden in oil. (27) Cleaning. (28) Sand blasting. (29) Test for shrinkage lengthways. (30) Ream hole. (31) Lap radius.

The operations on type 2 are:—(1) Cut off. (2) Grind off tit. (3) Centre both ends. (4) Turn knurled end. (5) Knurling. (6) Turn diameter thread. (7) Rough thread (to about two-thirds of depth). (8) Carbonising. (9) Heat up to 800 deg. and cool four times in water. (10) Anneal in charcoal. (11) Drill hole and countersink (note ⅛ in. has to be faced off. (12) Turn down middle. (13) Face ⅛ in. off front (to dead size, see operation 30). (14) Turn groove middle. (15) Drill vent hole (for hardening purpose). (16) Grind diameter thread maximum side (.0025 over size). (17) Grind diameter thread minimum side (.0025 over size). (18) Rough screw maximum end with 50 deg. sharp pointed tool. (19) Rough screw minimum end with 50 deg. sharp pointed tool. (20) Finish screw maximum end with 50 deg. sharp pointed tool. (21) Finish screw minimum end with 50 deg. sharp pointed tool. (22) Radius top maximum end (allow .001 for lapping). (23) Radius top minimum end (allow .001 for lapping). (24) Mill slot minimum end. (25) Turn away part thread. (26) Burring and marking. (27) Heat up to 800 deg. and harden in oil. (28) Cleaning. (29) Sand blasting. (30) Test for shrinkage lengthways. (31) Lap radius.

Check for Pitch Diameter.—This check must only touch the flanks of the thread, so there must not be a radius on the major diameter and the root must be sharp pointed. It is cut with a 55 deg. sharp pointed master tool ground on the fixture shown in Fig. 3. As the pitch of these checks must be absolute, it is best to make them out of cast steel and to finish them soft throughout.

Fig. 32 shows an enlarged view of the shape of the thread and the check itself. The diameter over the three wires B is major diameter of the female gauge + 2 x where x is calculated as follows: For Fig. 32:

$x = LO - LN.$

$LO = KL + \frac{1}{2} d.$

$KL = \frac{d}{2 \sin 27\frac{1}{2} \text{ deg.}}.$

$LO = \frac{d}{2 \sin 27\frac{1}{2} \text{ deg.}} + \frac{1}{2} d.$

$LN = .8004 P.$

$X = \frac{d}{2 \sin 27\frac{1}{2} \text{ deg.}} + \frac{1}{2} d - .8004 P.$

A = major diameter of female gauge — 2 × .073916 P (see Fig. 1).

The checks are again divided in two types.

Dimension D is made to suit the handle and the width C is made to suit the gauge to be checked. This check must enter the female and be a good fit without any slack.

Example.—Wanted a check for pitch diameter for a female gauge 1.998 = 14 R.H.

Diameter wire = .404.

$A = 1.998 - .0106 = 1.9874 \text{ in.}$

$B = 1.998 + \frac{.040}{.4617486} + .040 - .11434 = 2.01028 \text{ in.}$

Check for Full Thread.—The last and final check has a full thread that checks the entire shape. The distance over the three wires is the same as for the check for the pitch diameter. The major and minor diameter are exactly the same as for the female gauge. It has to enter the female gauge tightly like the check for the pitch diameter.

These checks are again divided in two types according to size.

The hole in type 1 and the width C are the same as for the check for the pitch diameter.

The material used is cast steel and it is finished and used soft.

The setting of the 55 deg. master tool for cutting upright is accomplished by a setting piece, similar to the one shown in Fig. 16, only the angle in a section through the centre must be 55 deg. and the gap is ground central.

FIG. 32

Example.—Wanted a full thread check for a female gauge, 1.998 = 14 R.H.

Outside or major diameter = 1.9980.

Dimension from top of thread one side to root of thread, other side = 1.998 — .04574 = 1.95226.

Dimension over three .040 wires = 1.998 + .01228 = 2.01028.

EFFORT TO CONSERVE FUEL SUPPLY

THE U.S. Fuel Administration is making an energetic effort not only to stop the waste of coal but to limit its use as nearly to necessary purposes as the conditions of supply require. A great deal of coal is used for purposes that can be easily dispensed with, even where there is not actual waste.

The official directions sent out to practically all the producers in the East and Middle West require preference to be given to the Government orders, railway fuel, household needs, public utilities, steel plants, coke ovens and munition plants, in that order.

The assumption seems to be that all of these may be adequately supplied if preference can be given to them in deliveries. Their importance is obvious enough, though in the case of household requirements many exceed what is really necessary for health and comfort.

One of the savings proposed is to be effected by the conservation of electric power, which is developed by a large consumption of coal. Among other things it is proposed that railroads which use that power, as most local and short lines do, shall limit their schedules and dispense with extra cars as far as feasible. It is also proposed that they use in cars less heat and light derived from electricity, which is generated by consuming coal. This is likely to be acceptable to operating companies as it will reduce their expense, but it rather comes in conflict with some demands, not only of those using the facilities but of local authorities.

Within that same period of memory not so very long, there was no electric light at all. Now it is squandered on a huge scale in cities, not in a comfortable degree of lighting merely, but in extravagant illumination of many kinds, kept up the greater part of long winter nights.

BOARD TO HANDLE EXPORT STEEL TRAFFIC IN U.S.

THE entire export traffic of the Eastern railroads in the United States in the unmanufactured forms of iron and steel, except those articles designed for use by the American Government, has been placed in the hands of a newly appointed committee of seven railroad presidents, representing Atlantic ports from Boston, Massachusetts, to Norfolk, Va.

These unmanufactured forms include billets, bars, plates, scrap and pig iron.

The committee's offices will adjoin those of the representatives of the Entente Governments in New York, who are in charge of purchase and transportation of munitions from this country.

At an organization meeting in New York the committee planned to take over ultimately all the overseas traffic of the Eastern roads, if the Government approves. Such traffic will include other commodities besides iron and steel.

George D. Ogden, freight traffic manager of the Pennsylvania Railroad, was appointed chairman of the committee. The committee was organized after a conference attended by British, French and Russian representatives interested in overseas traffic, and representatives of the railroads' war board and the trunk line association, together with officials of fourteen railroads.

ELECTRICALLY-CONTROLLED MOTOR BOATS

THE British Admiralty recently made the following statement on the subject of electrically-controlled motor boats:

The electrically-controlled motor boats used on the Belgian coast are twin petrol engined vessels partially closed in, and travel at a high speed. They carry a drum with between 30 and 50 miles of insulated single core cable, through which the boat is controlled electrically. The forepart carries a considerable charge of high explosive, probably from 300 lb. to 500 lb. in weight. The method of operating is to start the engine, after which the crew leave the boat.

A seaplane, protected by a strong fighting patrol, then accompanies the vessel at a distance of three to five miles, and signals to the shore operator the helm to give the vessel. These signals need only be "starboard," "port," or "steady." The boat is zig-zagged while running; this may be either intentional or unintentional. On being steered into a ship the charge is exploded automatically.

The device is a very old one. A boat similarly controlled was used in H.M.S. Vernon—the torpedo experimental ship —as far back as 1885. The only new features in the German boats are petrol engines and W.T. signals, neither of which existed then.

On November 3 the Admiralty announced that on the same day an attack by an electrically-controlled high speed boat was defeated and the boat destroyed. It was then pointed out that electrically-controlled craft, whether surface boats or torpedoes, were no novelty, and that in trials made in Stokes Bay in 1892 with an electrically-controlled torpedo the length of wire cable used was about 4,500 yards.

"HUSH" SHIPS DESCRIBED

A. ROUSSEAU, the naval critic of the "Temps," who returned recently to Paris from visiting the Grand Fleet, has been permitted by the British Admiralty (says a "Times" Paris telegram) to give French readers the first description of the famous "hush" boats, about which the authorities have succeeded in maintaining hitherto a profound secrecy.

"We were passing in front of ships of unusual aspect, specially constructed craft for war purposes, when certain of these vessels caught our attention, especially by their outline and dimensions. They were very long, with immense decks fore and aft. They appeared to lie low on the water. In the middle of the vessel rises a very squat central castle, at the extremities of which are heavy artillery turrets for two guns of biggest calibre.

"The secondary artillery, the calibre of which is the same on all vessels of the same type, is at the limit of the average of small artillery. The stem of these craft is tapered more like the stem of a yacht than that of a battleship, and has certainly been determined in order to realize very high speed, and as a matter of fact these vessels are very swift, much faster than the fleet test of pre-war cruisers.

"These craft—we may call them battle cruisers—are of two types, or rather dimensions, for their elements of power are, we believe, the same except as regards protection. These vessels have been created since the war. Inspired by the lessons of the war, they were begun in 1915, and have been in service twelve months, an admirable result of the organization of labor in British dockyards.

"Other vessels of the kind are under construction, their dimensions being yet more considerable. We were received on two of these vessels, and visited the fighting quarters, blockhouse, look-out station for submarines, a turret with its enormous guns, which fire two shells a minute, weigh 96 tons, and throw a shell weighing 1,947 pounds.

"Everything is organized to have fire control in one and the same hand and the laying by one and the same eye. The system invented by Sir Percy Scott a few years ago has made progress; heavy artillery and secondary artillery are no longer autonomous. Everything acts under one and the same direction. It is a truly remarkable system, and one which beyond all doubt has produced highly satisfactory results. Its installations on the new ships show that it has stood the test.

"These ships are capable of surprise action against which the enemy cannot guard himself, and their speed is a guarantee against a torpedo; but nevertheless they are fitted with devices to neutralize the explosion as far as possible. They are proof of the confidence of the British Navy in the powerful surface vessel, capable of heavy hitting, the only one which is able to assure mastery of the seas."

"THIS is a queer little hole of a country of yours, Pat," said one of the Fly boys to our friend the other day.

"Begorra, an' as quare as it is," replied Pat, "there's wan thing ye can do in it that ye can't do in yer own country."

"And what is that?" asked the draft evader.

"Hide!" replied Pat.

PROGRESS IN NEW EQUIPMENT

There is Here Provided in Compact Form a Monthly Compendium of Shipbuilding and Marine Engineering Auxiliary Product Achievement

HYDRAULIC TEST PRESS FOR 75 MM. SHELLS

AMONG the more or less novel features characterizing the manufacture of 75 mm. shell now being produced for the United States Government is the internal hydraulic test, and with a view to the rapid and efficient performance thereof a hydraulic press has been specially designed and is now being built by the Metalwood Mfg. Co., Detroit.

The purpose of the press is to provide suitable and convenient apparatus which will enable the shell to be filled, sealed, brought up to pressure and held there for the specified 15 seconds' duration of test. Observing this requirement, the press has a capacity of over two shells per minute, allowing an average of 1,200 to 1,500 shells per 10-hour period; the actual output varies somewhat with the ability of the operators to handle the work to and from the press.

The machine is so arranged that it combines both direct and intensified systems of operation based on a constant pressure of 1,500 lbs. per sq. in. in the accumulator reserve line. This is accomplished by having a suitably proportioned intensifying cylinder having a resistance head against which the nose of the shell is held. The intensifying cylinder is carried in a cross head, supported by two side frames, while the small ram

HYDRAULIC TESTING MACHINE FOR APPLYING INTERNAL PRESSURE TO 75 MM. U.S. SHELL.

which generates the intensified pressure is connected to the crosshead of the lower cylinder which extends below the floor level. The lower end of the lower cylinder is provided with a pull-back ram for withdrawing the intensifying plunger.

The cross-head referred to supports entire assembly of cylinders, which are two turned steel columns or tension members. The cylinder at the upper end of the columns clamps the shell against the resistance head in the bottom of the tank and is returned by pull-back springs.

In operating the press, the shell is immersed open end up to insure escape of all the air. It is then inverted and placed on the resistance head and clamped down tightly by the upper cylinder. The lower cylinder, which, as well as the upper one, operates under 1,500 lbs. pressure, forces the intensifying ram into the high pressure cylinder, the resulting pressure being communicated to the interior of the shell through the resistance head which seals the nose and maintains the internal pressure at the required amount, viz., 18,500 lbs. per sq. in. for 15 seconds. The remaining part of the test consists of a reversal of the foregoing.

Cast alloy steel is used for the high pressure cylinder, and a steel casting for the pull-back cylinder; the crosshead carrying the intensifying ram is a semi-steel casting, with bronze bearings.

The press is piped up complete for connecting to regulating valves, and the operation of intensifier and sealing clamp cylinder are controlled simultaneously by a single quick operating valve. High and low pressure gauges are included in the equipment.

EXCESS ELECTRIC POWER CONVERTED INTO STEAM

A TYPE of electric steam generator which for some years past has been in use in large numbers in many Italian works is illustrated in Figs. 1 to 5. The apparatus according to "Engineering," to which we are indebted for the illustration, is an invention of Engineer Revel,

FIG. 5. EXTERIOR VIEW OF BATTERY OF ELECTRIC STEAM GENERATORS

Colonel in the Italian Army, the manufacturing rights being held by Messrs. Luigi Boselli & Co., Milan.

The principle on which it works is the evaporation of water into steam by means of the heat dissipated in overcoming the resistance of the water to the passage of an electric current. As the flow of current depends on, and varies directly as, the volume of contained water acting as a conducting medium, the control is entirely automatic and demands no attention. Thus lack of feed water would only result in a decrease or stoppage in the production of steam until the supply of water to the boiler was resumed. An efficiency as high as 98 per cent. is characteristic of this type of boiler since the whole of the heat generated by the electrical energy is absorbed by the water, the only loss being that caused by radiation from the body of the apparatus.

Alternating current of from 200 volts

to 3,600 volts may be applied, the only difference between the high tension type and the low tension type being a modification in the shape of the electrodes and the dimensions of the steam dome. Fig. 5 illustrates the half of an installation of eight units taking three phase current at 6,000 volts, each apparatus being capable of generating 405 pounds to 450 pounds of steam per hour.

FIG. 1.

FIG. 2.

FIG. 3.

FIG. 4.

Figs. 1 to 4 illustrate a similar apparatus designed for 500 volts, the arrangement of the component parts being clear from the explanatory notes accompanying the illustration. For starting the generator the circuit-breaker is closed, the valve i is opened, and a small quantity of soda solution is introduced from the small receiver e to give a suitable conductivity to the water. When the water has reached the height of the lower edge of the electrodes the current flows through the water and commences to raise steam, the steam production increasing as the water-level rises, until it reaches the working pressure required. At this moment the regulator f enters into action, and the water-level and hence the steam production remain constant. In order to stop the apparatus the feed-water valve i is closed, the steam valve b is closed slowly, and the drain valve g is opened by acting upon the hand lever h until the ammeter has returned to zero.

When the feed water leaves a calcareous deposit it is advisable, every five or six hours, to free the boiler of the sediment deposited at the bottom of the truncated cone. This is obtained, without interrupting the working of the machine, by increasing the water feed and by acting at the same time on the handle h, the excess water washing away the sediment; this operation, by a suitable action upon the valves i and g, and by following closely the ammeter and maintaining the current intensity constant, is carried out without changing the water-level and without impairing the working of the apparatus.

The Revel generators are constructed to work at any pressure up to 14 atmospheres, and can be connected up at any time with the steam pipes from the ordinary steam boilers; owing to the rapidity of their action they take up any excess of hydro-electric energy which may be available even for a short time. They may, in fact, be considered as serviceable appliances for turning to account any superfluous hydro-electric power available, and as such they were utilized in numerous installations in Italy before the war, when the price of coal did not exceed 32s. per ton. At the present time they are also found to be practical and economical, even in cases where hydro-electrical power has to be paid for at the rates now ruling.

GUN-METAL FINISH

GUN-METAL finish consists in giving the surface of the material a thin coating of a chemical solution applied with a brush or sponge. After coating, the work is placed in a steam bath and maintained at a temperature of 100 degrees F. After a slight rust appears covering the entire surface, the work is taken out, placed in boiling water for about 20 minutes and then dried. When this is done a coating of black oxide will appear covering the surface. The operation must be repeated several times, scratch brushing the surface between each coating.

Several chemical solutions may be used to produce this gun-metal finish, of which the following represent good practice, according to Brass World:

Eight parts alcohol, 1 part ferric chloride, 8 parts water; or 3 parts hydrochloric acid, 4 parts nitric acid, 2 parts copper sulphate and 80 parts perchloride of iron; or 1 part each of chloride of copper and chloride of bismuth, 2 parts chloride of mercury, 6 parts hydrochloric acid and 50 parts of water.

With all of the above methods a very thin coating is formed on the surface of the steel. A process adopted by the French Government consists in applying chemical solutions which act on the metal, causing a thin layer to change its color, the shade depending upon the time of treating and the temperature. The exact formula for the chemical solutions used is not known.

Vol. XVIII. DECEMBER 13, 1917 No. 24

IS ENGINEERING ABILITY APPRECIATED AT ITS TRUE WORTH?

THE extent to which engineers of all grades have been called upon to participate in the war,—not, it is true, in the fighting line pure and simple, but in the production, supply and maintenance of all the gear necessary for the conduct of operations on present-day lines,—has done more to inform the world of its indebtedness to the engineering industry than would have been accomplished in fifty years of agitation along constitutional lines. Acknowledgement, however, must be made to Germany for having recognized the potential and active value of engineers, and for having encouraged to the point of insistence their education and training as part of the nation's business. That their value as wealth producers in peace and destroyers in war was also most fully recognized by that nation has been borne in upon the Allies only too well.

In considering the engineer as a factor in civilization, it is convenient to classify his efforts under three sections —first, the pure scientist who reasons and deduces; second, the applied scientist who searches, develops and demonstrates; third, the commercial scientist whose ability influences every line of industrial effort from making tacks to building "tanks." The third section embraces the great bulk of the profession, yet, except in the case of well-known men who have achieved fame as manufacturers and also of notable subordinates employed by them, its members are not brought prominently into the fierce glare of general publicity, while, in discharging their duties in any large aggregation of employees, their natural reservedness and acceptance of conditions as they are militates against a true recognition of the real value of their services.

The buoyant, assertive salesman, glibly recounting totals from his sales sheets, impresses all with his indispensability to his employer. Without him there would be no sales, with no sales no money, with no money no job. Therefore, all hail the salesman. How often though does the real and primary state of affairs dawn on those in authority? That the truth does occasionally come home is known to a few close observers, but that the man, who produces the wherewithal for the salesman to juggle with, gets, on the average, anything like the same thanks, tangible or otherwise, is a very rare occurrence.

Take a case in point,—during the depression before the war, a factory decided to add a certain apparatus to their product, and like many others before them copied, as a start, a competitor's design. Certain defects coupled with the prospect of litigation compelled them to drop the design, but the superintendent and draftsman were "ordered" to get out something to circumvent the competitive article. In other words they had to invent to specification. Success attended their efforts, but while done with the company's time and the company's money, the resulting design owed its success to a principle far removed from anything else of the kind and which would not have been thought of or successfully developed had not the superintendent and draftsman drawn upon their years of experience in other fields.

It is from this point onward that the inadequate recognition of the engineer becomes apparent. Produced in dull times, the device met with a favorable reception, entirely merited, and in actual fact had a great influence on the company's ability to weather the first few months of the war, but circumstances at the time were sufficiently unpropitious to induce the inventors to accept the promise of a very moderate sum in acknowledgment.

Soon after, trade improved; every other munition shop and other kinds of shops as well found the device useful, and the salesman began to smile for the first time in months. At the end of the year a good fat commission and a raise were his, also three weeks' vacation till orders were caught up on. The bargain with the other parties having been made when times were dull was out of all proportion to the respective merits of producers and salesman. Not only so, but a continual harassing for production to fill the orders turned in by the aforesaid salesman was the recoil effect suffered by the two engineers, while his resulting personal profits and prestige dwarfed their's completely.

The unfairness is obvious, yet the facts are substantially as stated. When times are good and everybody buys, the salesman is king, while the producing engineer is chased for deliveries. When times are dull and the salesman keeps out of sight, the designer has to both worry over goods which will induce sales and also reduce his cost of production. Yet of the two, which is the more indispensable?

The extent to which civilization has rested on the industrial accomplishments of man, the degree in which science and industry have contributed to the physical welfare and comfort of humanity has engendered, so gradually as to be almost unnoticed, a complete dependency on the engineer. The deprivation of numerous essential commodities, the excess of demand over supply, the search for equipment and materials for new processes, all these and other contributory conditions have to a considerable extent reversed the roles of salesman and engineer, and the man who can design and produce is, for the first time in years, valued at something approaching his true worth.

The chief feature in future business will be the ability to deliver the goods. For years to come the salesman must play the part of a man who goes out to look for known conditions, not to produce unsound demand and inflated sales. His success will be directly dependent on the confidence with which he can rely on the producer at home—if he knows that varying conditions will be met with cheerful adjustment, that unfair opportunities for excessive profits will not be snatched up viciously to the undoubted detriment of future business, if he will realize that without the goods he is helpless, then, perhaps, he may reconcile himself to being placed on an equal footing, both as to reward and prestige, with the man who gives him the wherewithal to barter.

Prices per lb. unless otherwise stated.

Market Condition and Tendency

Iron and Steel Shortage Continues—Pig-Iron Unchanged, Coke Scarcity Reduces Output—Lead and Spelter Prices to be Fixed.

AS was to be expected, the coming general election is having an unsettling effect on business. In spite of this, however, there is considerable activity in most industries although the shortage of raw materials is tending to restrict production. This is particularly true of manufacturers using iron and steel. The shortage of iron and steel is becoming serious, more especially in materials imported from the United States, where the extraordinary industrial activity is causing an enormous demand for steel. The large tonnage required for war purposes is placing the private consumer in a difficult position in regard to getting supplies for manufacturing purposes. This situation is reflected in Canada and is becoming more acute. There has been no change in prices of steel products this week and the market continues firm. Business in the steel trade is quiet and will likely remain so for the balance of the year. The mills on the other hand are very busy and continue to operate at capacity. The situation in the pig-iron market is unchanged, there still being a scarcity of basic iron for steel-making. The shortage of coke continues to cause considerable anxiety. In the States it has caused a serious reduction in the output of pig-iron, and in turn, of steel. Prices of non-ferrous metals are all unchanged. It is expected that prices of lead and spelter will be fixed shortly at Washington, which will steady the market. Tin continues in short supply although an effort is being made to relieve the situation.

MONTREAL, Que., Dec. 8, 1917.—Twice in as many weeks has Canada been brought face to face with two of the most important factors in the prosecution of a war; that of the raising of stupendous sums of money and the devastating character of the creations arising therefrom. The death and destitution which has been brought to our very door through the Halifax tragedy may give us a fuller realization of what the actual conditions must be in some of those European countries that have been overrun by the contesting armies, and thereby encourage us to "carry on" with renewed energy, so that our every effort may bring us nearer to an enduring and lasting peace. The activities that are likely to follow the closing of the loan are already in evidence and in all possibility business will receive added impetus before the opening of the New Year.

Pig Iron

The supply of pig iron for existing requirements is still a question of vital importance and conditions show little signs of improvement. Recent difficulties in connection with furnace operation and the inability to obtain sufficient raw materials for maximum production has intensified the acute situation that has been more or less marked for a considerable period. The action of the Government in endeavoring

to relieve the transportation congestion so very pronounced in certain districts may soon result in a better regulation of the distribution of materials and supplies; how this will be effected is as yet problematical but with the co-operation of the railroad companies the result will undoubtedly be improved facilities in transportation.

Steel

The steel situation may be said to be nearing another milestone in the uncertain developments that have marked the progress of events during the past six months. The time is approaching when the expected revision of prices as previously arranged will receive the consideration of the American Government, and with this end in view the War Industries Board and the heads of the copper and steel interests are expected to hold separate meetings within the next two weeks, at which conditions will be thoroughly investigated, and any readjustment for early future regulation will be determined on. While it has been stated that the beginning of the year would probably see some readjustment in various lines of steel commodities, the general feeling appears to be that, as the prices now ruling have only been in effect for a comparatively short time, no changes will be made in the immediate future. Some effort may be made to so regulate the price of steel that relief may be given to the domestic situation, but with the war demands ever on the increase, this development can only be a possibility, in view of the fact that every facility must be provided to maintain the production of essentials at the highest possible maximum. In this connection it is interesting to note that the American Government has taken steps to study the industrial situation with a view to curtailing such activities as are not directly associated with the prosecution of the war. The local situation has developed no features of consequence and dealers report unchanged conditions with prices holding firm at last week's quotations.

Metals

The metal trades are awaiting the outcome of the conference that will take place this week between the leading copper interests and the Government, at which meeting the question of revising the price of copper will be taken up. Other metals are expected soon to be placed under Government regulation, and this has the tendency to keep the market in a nervous condition. Tin is the all-absorbing question for the immediate present as the market is completely demoralized and prices are soaring. Spelter is unsettled but relatively firm. Lead is quiet with an easier tone. Antimony is in a stronger position and aluminum is firm.

Copper.—Without known exception, all trading in copper from the producer to the dealer or large consumer is now carried on under the regulations imposed by the Government, and as far as can be learned no transactions of any importance are carried on under the competitive basis. Small consumers are now in a better position to obtain desired supplies owing to the concession given to the dealers to dispose of small quantities of metal at a 5 per cent. commission over the fixed price of 23½ cents per lb. During the coming week a meeting will be held between the War Industries Board and the leading copper interests to consider the question of revising the price now governing the sale of copper. Maximum production is the essential factor at the present time and if a higher price would increase the available supply it is not unlikely that the Government may concede a better figure than that now ruling. War requirements, however, will receive the priority consideration even at the cost of lowering the prevailing price or maintaining it at the present level. Serious deliberation should nevertheless be given to the requirements of those users who, though not directly connected with the manufacture of war necessities, are in dire straights for lack of metal. A better figure on the open market would no doubt induce the smelters to produce more tonnage without materially affecting the demands for war purposes. The local market is devoid of features, and dealers are quoting last week's price of lake and electro, and 32 cents for castings.

CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the War Purchasing Commission appointed by the Canadian Government: Hormidas Laporte, Montreal, chairman; George F. Galt, Winnipeg; William P. Gundy, Toronto. Thomas Hillier is secretary, and the Commission headquarters are at Ottawa.

Tin.—The market is in a position of extreme nervousness over the increasing shortage of tin supplies, and the inability to obtain reliable information regarding tin shipments from abroad. The situation in the States is becoming very acute and measures will soon have to be taken to avoid a condition fast approaching a tin famine. What little tin is now available is practically controlled by the Government and this is being conserved to the utmost. The London market has continued to rise to a record high position but has shown a slightly easier tone during the past few days. An advance of 4 cents per lb. has been noted on the New York quotations, the nominal price now asked being 85 cents per lb. The demand on the local dealers has shown an increase and prices have been advanced to 78 cents, this being 6 cents higher than last week.

Spelter.—The situation is still marked by the unrest that has been characteristic for many weeks, owing to the delay on the part of the Government in fixing prices to control the sale and distribution of the metal. While this uncertainty is so pronounced, the situation will continue to be more or less demoralized, as producers are not anxious to operate their plants at capacity under prevailing conditions, or until the Government announce the volume of their future requirements. The New York market is quiet and weak; dealers here report a steady market with prices firm at 10½ cents per lb.

Lead.—The market is quiet pending the action of the American Government towards the regulation of prices, a feature that is expected to develop in the very near future. It is anticipated that a one-price-for-all will be the basis of the regulations, but some concession may be given to dealers for their part in the handling of the metal. The New York market is being well maintained but price quotations show an easier tone, particularly on the part of the independents. Local lead is selling at about 9½ cents per lb. on a quiet but steady market.

Antimony.—The market has taken on a firmer tone and prices are stronger. Dealers appear to be acquiring metal but apparently the consumer demand has shown little increase. Generally the situation is better with an undertone of early activity. Prices in New York have advanced 1⅛ cents during the week, the current price being 15½ cents per lb. The local market is a little more active and dealers have advanced to 18 cents, this quotation being one cent higher than last week.

Aluminum. — The situation is quiet but with a better undertone; prices are unchanged and firm at 60 cents per lb.

Machine Tools and Supplies

The expected revival of munitions activity has renewed the interest in the machine tool industry, the importance of which has been reflected in the gradual increase in business that has been noted in this direction, much of recent demand being for equipment suitable for shell production. Plants that have received contracts for American shells are rapidly being equipped and manufacturing operations will soon be in full swing. Inquiry for general tool equipment has not been so active during the past week but the volume is still of an encouraging character. A feature of the present situation is the increasing difficulty experienced in obtaining machinery from the States, this being due to the abnormal demand for equipment in Government plants there, and those plants that are exclusively operating on Government work. Even work on order for Canadian buyers may be commandeered for use in the States on the priority claim of the American Government. These conditions are expected to give considerable impetus to the production of Canadian-made tools when further orders have been placed for additional shells. A more stabilized condition exists in the market for machine tool supplies, this no doubt resulting from the more uniform condition prevail-

ing in the prices of the raw and semi-finished materials. Quotations on supplies are, however, very firm with the demands slightly on the increase.

Scrap

The failure of the scrap dealers to agree regarding the fixing of a reasonable price to govern the sale of various scrap materials is delaying the action of the American Government in setting prices on old materials. It was thought that the scrap situation would automatically adjust itself to the conditions that would arise from the fixing of steel and metal prices, but the market in scrap has been in a very unsettled state for the past two months, everyone uncertain as to what the next move was to be. Tin scrap of all kinds is very strong and higher prices are asked but the general market is unchanged with quotations uncertain but nominally the same as last week.

Toronto

TORONTO, Ont., Dec. 11.—The coming general election is affecting business in that it is tending to create unsettled condition inevitable under the circumstances. Business is as active as the shortage of raw materials will permit, and in this respect there are no indications of improvement.

The unfortunate fire at the Polson Iron Works has not stopped operations in any of the departments, except the pattern shop. The most serious loss was a large number of patterns. About fifty plates on a freighter under construction were damaged and will have to be replaced, while the furniture and rigging for this vessel were also destroyed. A new pattern shop is being built on another site.

Steel

There have been no developments of importance in the iron and steel market during the week. There is a general complaint concerning the shortage which appears to be affecting everybody in the trade, merchant and consumer alike. What will eventually happen is difficult to say, but the situation is getting more acute as time passes. It is becoming more apparent that little relief may be looked for in regard to supplies of iron and steel from the United States, for even consumers in that country are experiencing considerable difficulty in obtaining steel for purely domestic purposes. This being so, consumers in Canada can hardly expect preferential treatment, except when the material is required for war purposes. The outlook for the manufacturing consumer is not at all encouraging, the demand for steel for war purposes getting heavier all the time, with the result that manufacturing operations will become even more restricted than at present.

The Canadian steel companies continue to enjoy unusual prosperity and have plenty of business on hand. Considerable of this business is for munitions and other war purposes; as a result, consumers not engaged upon war work are finding it difficult to get material as quickly as they would like. It is more than likely that the mills will get further behind on deliveries on account of the new munition contracts. There have been no price changes announced during the week and the market continues firm. Prices of imported material have not undergone any change. Although the fixed prices on semi-finished and finished steels are being quoted on all new enquiries in the United States market, buyers find it almost impossible to get any material for prompt delivery. Canadian importers are, therefore, unable to meet the demand and business is suffering in consequence. The fixed price schedule comes up for revision in January, but there are no indications that any change will be made from the prevailing level. The continued decline in new business in the States is shown in the further decrease in the U.S. Steel Corporation unfilled tonnage. The unfilled orders of this Corporation on November 30 last were 8,897,106 tons, representing a decrease of 112,569 tons as compared with the orders on October 31.

Pig Iron

The pig iron market is quiet and prices continue unchanged. Foundry irons are in fair supply, but there is a shortage of basic pig iron and, as a result, steel mills have been importing basic iron from the States. There is practically no relief in the coke situation which is causing much uneasiness among users of imported coke. In the States, on account of the shortage of coke, it is feared that operations at the furnaces will be further restricted, thus seriously affecting the steel mills.

Scrap

The market continues dull with no business to speak of. Conditions in the scrap market are much the same as they have been for some weeks. The scarcity of cast iron and steel scrap is keeping prices firm for these materials, but copper, lead and zinc., etc., are weak, although prices are unchanged.

Machine Tools

The situation in the machine tool market is unchanged. Business continues good with prospects of increased activity in the near future. It is becoming more difficult than ever to obtain machine tools from the States, owing to the heavy demand there. Government business predominates to the exclusion of everything else, with the result that private buyers have to wait.

Supplies

Business in machine shop supplies continues good at firm prices. There is an upward tendency in some lines on account of the high cost of raw materials, but as a rule the market is steadier than it was a few months ago. Maple Leaf cotton duck belting has advanced, the new discount being 25 and 5 per cent. off list, the former discount being 25 and 10 per cent. off. The principal grades of crude oil have advanced in the States, ranging from 10c to 25c per barrel, according to grade. Pennsylvania crude advanced 25c to $3.75 per barrel. Local prices of gasoline and oils have not changed.

Metals

The situation in the metal markets is the same as last week and prices are unchanged. There is no apparent relief in the tin situation, there being no spot tin available and considerable uncertainty in regard to future supplies. The copper market is quiet and situation unchanged. The pending orders for shrapnel have not as yet produced any activity in lead and antimony, although a heavier demand for these metals is anticipated.

Copper.—The copper situation is improving, although the market continues quiet and prices unchanged. Production of copper is gradually increasing and prospects are that there will be soon sufficient metal to meet the general commercial demand. Lake and electrolytic are quoted at 32c and castings at 31c per pound.

Tin.—The scarcity of tin continues to be acute, there being practically no spot metal obtainable. The industry is anxiously watching the result of negotiations between Washington and London, in the hope that existing regulations may be modified and a more liberal supply of tin be allowed to come forward. Tin is unchanged and nominal at 80c per pound.

Spelter.—The market is quiet and there is very little demand. It is expected that the U.S. Government prices for spelter will be announced in a few days. Local price 10½c per pound.

Lead.—Government prices are also expected for lead in a few days which should have the effect of stabilizing the market. The market is quiet and is likely to remain in this conditions for balance of the year. Lead is quoted locally at 8½c per pound.

Antimony.—The situation in antimony is unchanged and the market is quiet, although prices are firm at 10c per pound.

Aluminum.—The market is steady and quotations unchanged at 62c per pound.

Pittsburgh

PITTSBURGH, Pa., Dec. 8.—Official announcement was made during the week by the Council of National Defense that representatives of the steel and copper industries had been invited to meet the War Industries Board on Monday, Dec. 10 and Friday, Dec. 14, in view of the fact that the price agreements were upon the understanding that the prices were subject to "possible revision" at the expiration of four months in the case of copper and "prior to Jan. 1" in the case of iron and steel. Early in the price fixing operation the iron and steel producers had an idea that the Washington authorities would be disposed to contend for further reduction Jan. 1 or soon thereafter, but as costs have been mounting and manufacturing difficulties increasing they have lately doubted whether any serious effort would be made to secure reductions. It is pointed out that even if there is no definite desire that a change be made in prices it is necessary that some action be taken prior to Jan. 1, otherwise the trade would be left in doubt. The balance of

probability is that next Monday's conference will result in no price change, the agreement being continued either to a specified date or indefinitely. As there is some prospect of the Pomerene iron and steel price fixing bill becoming a law, now that Congress is again in session, the Washington authorities might prefer to have the agreement continued without any definite date.

Greater Scarcity

Pig iron, unfinished steel and the general run of finished steel products are still scarcer. It is practically impossible to buy any Bessemer or basic iron in this district, and little if any foundry iron except for shipment after April 1. In billets and sheet bars there are only occasional odd lots available, chiefly steel, off in analysis, which must seek a consumer who can use the particular material. There are almost unlimited offerings of discard steel, and even when the mill will roll to sizes desired, even down to 1½-inch billets, there is only occasional demand. Such discard steel is offered at the set prices for soft steel or at a shade less. In bars, shapes and plate there are scarcely any offerings. Wire products are in moderately fair supply, as are sheets, while tubular goods are extremely scarce.

Practically all the trade reports in the past three weeks have been of the tenor that there has been such a great restriction in the production of both pig iron and steel, due chiefly to shortage of coke, that a fresh scarcity has resulted. The conclusion was based largely upon theory and partial information. The supply of Connellsville coke has been extremely scant, and furnaces depending upon the region have had to bank in many cases for longer or shorter periods. The amount of steel consumed for ordinary commercial purposes has continued to decrease. Nevertheless steel has grown scarcer if anything, and certainly has not grown more plentiful. The conclusion in most quarters has been that the supply has been feeling the effects of restricted production. This is not correct. What has been lost in production in some districts has been made up in others. Production of pig iron in November was at a slightly greater rate, on an average, than production in October. The Pittsburgh district gained a trifle, the Youngstown district and some others losing, while Chicago made quite a gain. The steel ingot statistics for November are not yet available, but they will in all probability show an increase, for there has been decreased consumption of pig iron by iron foundries and pig iron on the ground has been well cleaned up.

The unknown element, which apparently has confused the judgment of so many, is the tonnage of war steel being produced. There are various reports as to Government orders placed, mentioning specific tonnages, but it should strike one as curious that those who make these interesting reports never stop to add up the tonnages, nor do they state the period of time in which delivery is to be made. The fact is that nobody knows how much steel per month the war is taking, or is about to take. From the fact that the rate of production is well maintained, and the further fact that the commercial consumption of steel is constantly decreasing, it is evident that the war tonnage has greatly increased. While there seemed to be reason two or three months ago to conclude that the amount of steel required by the Government and its Allies for war purposes, direct and indirect, would not be less than 30 per cent. or more than 40 per cent. of the total production, on the basis of a rate of production of finished rolled steel of 33,000,000 gross tons a year, it is well to conclude now that the tonnage is going to be greater, if it is not already greater. A proportion of 35 per cent. would be one million tons a month.

MARKET LETTER DEVELOPMENT

The attention of metal working plant executives is directed to the enlargement of the scope and usefulness of our Market Letter Department. In New York and Pittsburgh, expert correspondents have been engaged, and are already furnishing each week concise reports of production activities, price movements, etc., within the territory served by each of these important centres. During the next few weeks, further additions will be made to the number of our United States correspondents, embracing other industrial centres, and enlarging thereby the scope of the meantime service being rendered.

Capacity

While production is maintained, it is well below capacity, because capacity is increased. The country may be making steel ingots at the rate of more than 44,000,000 tons a year, the rate shown for October, but the capacity is estimated at 50,000,000 tons, whereas the production of 41,400,000 tons in 1916 represented very nearly the entire capacity available in that year. In pig iron, too, the rate of 39,300,000 tons a year shown for the past few months is probably 2,500,000 tons short of what could be done if all conditions were favorable, particularly as to transportation.

Better Freight Movement

The General Operating Committee, conducting a pooling of the facilities of the railroads east of Chicago so as to produce maximum freight movement, issued certain orders, as noted in last report, aimed particularly at clearing the congestion in the Pittsburgh district. These orders have already borne a little fruit, conditions being visibly improved, though not much as yet. The whole matter has been put in broader form before Congress by the report made last Wednesday by the Interstate Commerce Commission, looking to the Government taking over the operation of all the roads, or the roads being allowed freely to form a general pool. The prospect distinctly is that there will be continually improved freight movement, except for restrictions imposed by winter weather (there has been a heavy snowfall in the past few hours), with consequent better movement of coal and coke and heavier production of pig iron and steel, also that there will be some large orders placed for locomotives and cars, under Government priority orders throughout, as to the furnishing of the materials and despatch of the work in the car and locomotive shops. In other words, prospects are that there will be more steel produced and still more war steel required.

Markets Inactive

The markets have been quite inactive, there being scarcely any material to offer. Output is fully taken up with Government orders and requirements in commercial steel against old contracts, even though specifications against contracts are as a rule at a relatively light rate. The set prices are being well observed in the case of buying by the Government, its Allies, and the domestic trade. They do not apply to export sales of ordinary commercial steel.

TO RETURN CARS TO CANADA

U. C. GILLON, Chairman of the Administration Board of the Canadian Railway Association for National Defence; Sir George Bury, vice-president Canadian Pacific Railway Co., and W. M. Neal, general secretary of the Association, were in New York, December 6, to have a conference with members of the American Railway Association in an endeavor to have the American railways send to Canada the Canadian cars that are now in the United States or an equivalent number of cars owned by railroads in the United States.

They pointed out at the meeting that there were 20,000 more Canadian-owned cars in the United States than there are American-owned cars in Canada, and that, although promises have been made that Canadian or American cars would be sent from time to time, yet in two months, notwithstanding several thousand American-owned cars have been sent to Canada, the Canadian roads had gained less than 990 cars .

ITALIAN MARKET FOR PIPE FITTINGS

A REPORT from the United States Consulate at Florence published in Commerce Reports for April 27, 1915, stated that the Italian market for pipe fittings was controlled by German and Swiss manufacturers and that fittings made by American manufacturers had been found unsatisfactory.

At the present time there is an urgent demand throughout Italy for fittings. Stocks of German and Swiss goods have been sold out, Great Britain requires

its goods for its own use, and France seems to be unable to pick up the Italian trade. A good market is offered to American manufacturers if they will conform to local requirements. The principal requirement is that fittings must have right-hand threading of English standard. Even left-hand thread might be used if of English standard. The differences between English and American standard thread is shown in the following table:—

Size of pipe, in inches—	Threads per inch English	American
⅛	28	27
¼	19	18
3-5	19	18
½	14	14
¾	14	14
1	11	11½
1¼	11	11½
1½	11	11½
1¾	11	11½
2	11	11½
2½	11	8
3 to 6	11	8

These standards for pipe up to 2½ inches look so much alike that without actual counting and measurement careless employees are apt to get them mixed, with consequent cutting of threads or jamming of fittings. It must be said, however, that this market is accustomed to and wants fittings with English standard threading. This is true of most of Europe. American manufacturers who hope to compete with European manufacturers must make up their minds to this fact.

The American practice of threading sleeves at each end does not obtain here. Sleeves in Italy carry a right-hand thread through their length. Furthermore, this market uses quantities of bends, particularly 90 deg. bends, which seem to be no longer made in the United States. Before the war, these could be obtained in any desired quantity from German and Swiss manufacturers. At the present time there is a tremendous demand for wrought iron flanges, which seem to be unobtainable.

With one or two exceptions, the materials used in and the finish of American fittings are said to be markedly inferior to those of Swiss and German manufacture. It is claimed that roughly finished moulds are used in castings and a poor quality of iron employed, with the result that the finished product has numerous pits inside and out. These cause rough threads and rust. Swiss and German fittings are of better material, stronger, and of lighter weight. Owing to the use of better moulds in casting, fittings have smooth, even surfaces. As to splitting, the consulate has been told that they seldom split, whereas this is of frequent occurrence with American fittings.

Other complaints of American fittings are that those for pressure use have flat bands instead of the round bead wanted in this country; and that reducers, instead of carrving the same thickness of metal throughout in proportion to the diameter of the several openings, carry the same outside diameter, which, according to Italian taste, makes a bulky, ugly piece of work. This taste requires a careful finish and proportion in all metal work. Whether or not American work is as strong or stronger is not the question. The point is that work must be turned out to suit the market. Any American manufacturer willing to do this can get a hold on this market at the present time that will insure him a permanent outlet for his goods.

Fittings and pipes are not separately classified in Italian import statistics but are lumped with other manufactures of iron. Pipes of American manufacture are the best in this market and have commanded the trade for years. If care were taken with fittings, American fittings, helped by the reputation of American pipe, would soon have the same enviable position here.

THE INVENTION OF THE STEAM HAMMER

NASMYTH invented his huge steam hammer to forge the paddle shaft of the Great Britain on Nov. 24, 1834, but Brunel recommended the screw propeller after the trials of the Archimedes by Francis P. Smith, and this upset all the arrangements for the use of the hammer, but the iron trade which had been slack for some time revived and Nasmyth used and patented his hammer in 1842 after his return from France. The hammer was so accurately made that he showed the Lords of the Admiralty at Devonport Dockyard, how a blow could be made so gentle as to crack the end of an egg placed in a wine-glass, as if done by an egg-spoon, and the next blow so violent as to rattle all the china in a home a quarter of a mile distant.

Another of Nasmyth's inventions was riveting by compression. One wet wintry Sunday afternoon he went to his workroom to perform some repairs to a small stone which required to be riveted, and as the noise of riveting might be heard he solved the difficulty by using the jaws of his bench vice to press in the hot rivets. This system of riveting was long afterwards patented by Smith of Deanston, with William Fairbairn of Manchester. It is extensively used in boilers, girders, and all other wrought-iron structures where sound riveting is absolutely essential, and by hydraulic power a considerable portion of iron shipbuilding is carried out by the silent squeeze system in place of hammers. When Nasmyth continued the silent and very effective method of riveting he named it "The Sunday Rivet."

INDUSTRIAL DEVELOPMENT IN JAPAN

THE following observations regarding the formation of industrial companies in Japan since the outbreak of the war have been furnished by E. F. Crowe, Acting Canadian Trade Commissioner, Yokohama:

Metals

Although the iron industry of Japan is still in its infancy, it gives promise of assuming considerable importance in the future. Before the war the annual production of Japan was about 260,000 tons of iron, this being around one-half of its consumption. Since the war several new companies have been formed for the production of iron. Six companies with a combined capital of 40,000,000 yen have established new works.

With regard to steel, three new companies have commenced operations and four new works have been established. Their total combined capital is estimated at 5,000,000 yen. One company is producing steamer shafts, railway wheels, and tires as well as supplying the home trade. They have received orders from China and India. It is stated that the intention of this company is to devote all its energy to the export trade rather than to the domestic field.

It is generally conceded that the future of the zinc industry of Japan is good and that a large export trade is to be expected after the war. One company is already manufacturing zinc for exportation. Japanese zinc ore contains many other metals, such as gold, silver, and copper and the refining of these metals is carried on along with the treatment of the ore. Five new zinc companies are operating six works for the treatment of Japanese zinc ore and have a total combined capital of 7,600,000 yen.

In March, 1916, a company was formed with a capital of 1,000,000 yen for the manufacture of aluminum. It is stated that the process to be used is different from that in vogue in Europe and the United States. The alumina is obtained from a clay which is a product especially of Japan and is treated by an electrolytic process.

A company was formed in January, 1917, with a capital of 100,000 yen for the purpose of producing sheet lead for the use of chemical industries. Sheets are being turned out measuring ten feet by four feet and it is claimed that they are superior to any which have hitherto been manufactured in Japan.

Metal Goods

A company which was first established in 1913 for the manufacture of galvanized iron sheets and galvanized iron wire has increased its capital from 300,000 yen to 700,000 yen. Up to the present its output has been confined to the home market but it intends to export its products later.

Two companies with a combined capital of 1,500,000 yen have been formed for the purpose of manufacturing wire netting.

Machinery

For the manufacture of machinery, three new companies with a combined capital of 2,300,000 yen have been established. In addition to the manufacture of munitions, rotary printing machines, etc., and gun metal are also being manufactured.

Electrical Supplies and Accessories

There have been formed during the period under review six companies for the manufacture of electrical supplies and accessories, such as electric motors, dynamos, switches, lamp bulbs, carbon electrodes, carbon brushes, etc. Their total combined capital is 4,530,000 yen and they operate eleven factories. An improved process for the manufacture of micanite has enabled a Japanese com-

pany to turn out insulators both for the domestic and export trade.

Mining

There have been organized three coal mining companies with a combined capital of 1,550,000 yen. One company is also producing coke in large quantities. In December, 1916, a company was formed with a capital of 120,000 yen to exploit a sulphur mine. A special process is used in refining the raw material.

Note.—A yen equals approximately 50 cents at the normal rate of exchange.

TRADE ENQUIRIES

THE following trade enquiries have been received by the Department of Trade and Commerce, Ottawa. Further particulars may be obtained on application to the Department.

1470. **Agency.**—A firm of Government contractors in South Africa who are also contractors for a number of large concerns throughout the country wish to arrange to act as agents for Canadian motor-cars, tires and tubes and motor-cycle tires. They are particularly anxious to make connections for after-the-war business.

1473. **Acetate of cobalt and manganese.**—A London company asks to be placed in touch with Canadian producers of acetate of cobalt and of manganese, who can offer supplies.

1475. **Raw potash felspar.**—A Midlands company asks to be placed in communication with Canadian producers of raw potash felspar who are favorably situated for export to the United Kingdom.

1482. **Wire for bedstead manufactures.**—A firm of Birmingham, Eng., bedstead manufacturers requires large quantities of wire of the following kinds: Coppered hook wire; bright spring wire; galvanized mat wire; tinned hood wire; 1C4 bright spring wire, quality as the japanned spring; galvanized strip. Further particulars and samples of wires may be had on application to Commercial Intelligence Branch, Department of Trade and Commerce, Ottawa.

1486. **Sulphite lye.**—A London manufacturing company wish to ascertain if they can obtain sulphite lye, a by-product of the pulp industry, from Canada, and would be glad to hear from producers able to offer regular supplies. Full particulars obtainable at Commercial Intelligence Branch, Department of Trade and Commerce, Ottawa.

1488. **Acetate of soda.**—A Lancashire firm asks for names of Canadian manufacturers of acetate of soda.

1495. **Sulphite (wood) pulp.**—London firm ask for quotations c.i.f. Bilbao, Spain, or Genoa, Italy, for 100 tons and 1,000 tons of strong, easy bleaching and bleached sulphite (wood) pulp.

1497. **Heating Appliances, flooring, etc., paints and oils.**—An inquirer in Newfoundland wishes to be placed in touch with Canadian manufacturers of church and house-heating appliances, maple flooring and cedar shingles, paints and oils.

Enlarged Canadian Trade Intelligence Service

Under the arrangement made by the Minister of Trade and Commerce with Sir Edward Grey in July, 1912, the Department of Trade and Commerce, Ottawa, is able to present the following list of the more important British Consulates whose officers have been instructed by the Foreign Office to answer inquiries from and give information to Canadians who wish to consult them in reference to trade matters.

CHILE—Valparaiso, British Consul General.

COLOMBIA—Bogota, British Consul General.

ECUADOR—Quito, British Consul General. Guayquil, British Consul.

EGYPT—Alexandria, British Consul General.

FRANCE—Havre, British Consul General. Marseilles, British Consul General.

INDIA—Calcutta, Director-General of Commercial Intelligence.

ITALY—Genoa, British Consul General. Milan, British Consul.

MEXICO—Mexico, British Consul General.

NETHERLANDS—Amsterdam, British Consul.

PANAMA—Colon, British Consul. Panama, British Vice-Consul.

PERU—Lima, British Vice-Consul.

PORTUGAL—Lisbon, British Consul.

RUSSIA—Moscow, British Consul General. Petrograd, British Consul. Vladivostock, British Consul. Odessa, British Consul General.

SPAIN—Barcelona, British Consul General. Madrid, British Consul.

SWEDEN—Stockholm, British Consul.

SWITZERLAND—Geneva, British Consul.

URUGUAY—Monte Video, British Vice-Consul.

VENEZUELA—Caracas, British Vice-Consul.

BRAZIL—Bahia, British Consul. Rio de Janeira, British Consul General.

Canadian Commercial Intelligence Service

The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.

CANADIAN TRADE COMMISSIONERS.

ARGENTINE REPUBLIC—B. S. Webb, Acting Canadian Trade Commissioner, Reconquista, No. 46, Buenos Aires. Cable address, Canadian.

AUSTRALIA—D. H. Ross, Stock Exchange Building, Melbourne. Cable address, Canadian.

BRITISH WEST INDIES—E. H. S. Flood, Bridgetown, Barbadoes, agent also for the Bermudas and British Guiana. Cable address, Canadian.

CHINA—J. W. Ross, 13 Nanking Road, Shanghai. Cable address, Cancoma.

CUBA—Acting Canadian Trade Commissioner, Lonja del Commerci, Apartado 1290, Havana. Cable address, Cantracom.

FRANCE—Phillipe Rey, Commissioner General, 17 and 19 Boulevard des Capucines, Paris. Cable address, Stadacona.

ITALY—W. Mc. Clarke, c/o H. M. Consul, Milan.

JAPAN—E. F. Crowe, Acting Canadian Trade Commissioner, P. O. Box 109, Yokohama. Cable address, Canadian.

HOLLAND—Ph. Geleerd, Acting Canadian Trade Commissioner, Zuidblaak, 26, Rotterdam. Cable address, Watermill.

RUSSIA—C. F. Just, Canadian Government Commercial Agent, Alexandrinskaia, Plosch 9, Petrograd. L. D. Wilgress, Canadian Government Commercial Agent, Bukhgolza Ulitza No. 4, Omsk, Siberia.

NEWFOUNDLAND—W. W. Nicholson, Bank of Montreal Building, Water Street, St. John's. Cable address, Canadian.

NEW ZEALAND—W. A. Beddoe, Union Buildings, Customs Street, Auckland. Cable address, Canadian.

SOUTH AFRICA—W. J. Egan, Norwich Union Buildings, Cape Town. Cable address, Cantracom.

UNITED KINGDOM—Harrison Watson, 73 Basinghall Street, London, E.C.2, England. Cable address, Sleighing, London. N. D. Johnston, Sun Building, Clare Street, Bristol. Cable address, Canadian. J. E. Ray, Central House, Birmingham. Cable address, Canadian. J. Forsyth Smith, 31 North John Street, Liverpool. Cable address, Cantracom. F. A. C. Bickerdike, 4 St. Anne's Square, Manchester. Cable address, Cantracom. J. Forsyth Smith, Acting Canadian Trade Commissioner, 87 Union Street, Glasgow, Scotland. Cable address, Cantracom.

CANADIAN COMMERCIAL AGENTS.

AUSTRALIA—B. Millin, Royal Exchange Building, Sydney, N.S.W.

BRITISH WEST INDIES—Edgar Tripp, Port of Spain, Trinidad. Cable address, Canadian. R. H. Curry, Nassau, Bahamas.

NORWAY AND DENMARK—C. E. Sontum, Grubbegd No. 4 Christiania, Norway. Cable address, Sontums.

SPAIN—J. F. Roberts, Hotel Cuatro Naciones, Barcelona.

CANADIAN HIGH COMMISSIONER'S OFFICE.

UNITED KINGDOM—W. L. Griffith, Secretary, 17 Victoria Street, London, S.W., England. Cable address, Dominion, London.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

ENGINEERING

Thorold, Ont.—A hydro-electric by-law will be submitted to the ratepayers.

Calgary, Alta.—The Calgary Rolling Mills are building an addition to their plant.

Owen Sound, Ont.—It is understood that J. H. Cole has selected a site for the proposed screw factory.

Toronto, Ont.—A building permit has been issued to the Canada Metal Co., for a factory addition at 17 Fraser Ave., to cost $2,000.

Chatham, Ont.—The T. H. Taylor Co. is in the market for a complete outfit of Jones under feed stokers, and for two boiler installations, including engines and fans, etc.

Toronto, Ont.—A building permit has been issued by the City Architect to the Liquid Air Society to erect a one storey tile and steel addition to their factory at 18 Boler street. The cost will be $2,600.

Toronto, Ont.—The Hydro-Electric Commission propose making extensions to the Ontario Power Co's. plant at Niagara Falls, so that by July next some 25,000 extra horse-power will be available and another 20,000 a month or so later. The cost is estimated at $1,000,000.

Toronto, Ont.—Fire on Friday evening destroyed the pattern shop and pattern storage, and also damaged one end of the plate shop at Polson Iron Works. A large number of valuable patterns were destroyed and a freighter which was under construction was damaged. The loss is estimated at about $200,000, which is covered by insurance. The company have already started building a new pattern shop.

GENERAL

Winnipeg, Man.—The Prest-O-Lite Co. will build a factory at St. Boniface, to cost $10,000.

Oshawa, Ont.—A shoe factory may be established here if satisfactory arrangements can be made with the council by the company interested in the project.

Sault Ste. Marie, Ont.—Fire on Dec. 3 of unknown origin caused a loss of several thousand dollars to the Standard Chemical Co. plant. The loss in the latter fire was $7,000.

Orangeville, Ont.—It is reported that the local cement plant, which has been idle for four years, has been sold to a Kingston concern who propose manufacturing a fertilizer.

Toronto, Ont. — The Massey-Harris Co. have taken out a permit to build a dry kiln on the west side of Shaw street, near Strachan avenue and King street, to cost $5,000.

MUNICIPAL

Lumsden, Sask.—The Town Council will appropriate $7,000 to acquire the plant and equipment of the local electric light and power company.

Whitby, Ont.—The by-law granting a loan of $25,000 to the United Rubber Mfg. & Reclaiming was passed by the ratepayers by a large majority.

Galt, Ont. — The City Council have passed two by-laws, one to pay $45,000 on extensions to the hydro-electric system and another to extend the waterworks system at a cost of $18,558.

Sherbrooke, Que.—The city attorney has been instructed to prepare a by-law authorizing the city to issue debentures to the amount of $150,000. This sum is made up as follows: New power dam, accessories, generators and turbines, on Frontenac street, $116,000; turbines, transformers, regulators, tools and apparatus at Rock Forest power station, $34,000.

Toronto, Ont.—Works Commissioner Harris has recommended that the Board of Control instal air chambers at the main waterworks pumping station. He explained that the air chambers were needed to safeguard the works from damage to the machinery in case of any temporary suspension of the Hydro service which might occur. Commissioner Harris estimated that the work would cost about $50,000. He was authorized to receive tenders for the work.

Montreal, Que. — The Canadian Machine Co., who contemplate building a factory at Maisonneuve, have asked the city council for a guarantee of $250,000 debentures. The council stated that no action could be taken on this matter until it was known how much the company would invest, and that the company would have to conform to the city by-law in the matter of securing aid. It was stated that the company had factories at Nashua, N.H., and Boston, Mass.

BUILDINGS

Toronto, Ont.—City Architect Pearse has granted a building permit to the Bank of Hamilton to erect a three-storey brick bank building at 341 Yonge street at a cost of $4,000.

Toronto, Ont.—Permission has been granted the T. Eaton Co. to erect a one-storey brick delivery building, to cost $45,000, at the corner of Coxwell avenue and the G.T.R. right of way. Building operations have already been commenced.

PERSONAL

L. W. Adam of Bethlehem, Pa., has been appointed to the position of General Superintendent of the Nova Scotia Steel & Coal Co's. plant at Trenton, N.S. Mr. Adam will reside at New Glasgow, N.S.

Lawrence Russel, who for several years has been sales manager of the Armstrong, Whitworth Co. of Canada, Montreal has been appointed assistant general manager of the company.

Herbert Johnston of the sales staff of the Armstrong, Whitworth Co., Montreal, has been appointed city sales manager, to succeed L. Russel, recently appointed assistant general manager.

John Ross, general superintendent of the mill of the Abitibi Power & Paper Co. at Iroquois Falls, Ont., was caught in the transmission and instantly killed recently. Mr. Ross was one of the highest paid paper experts in America and had been employed at the Abitibi about one year. He was forty-two years of age.

Capt. Arthur J. Latornell, B.A.Sc., at one time city engineer of Edmonton, Alta., has died of wounds received in action in France. Capt. Latornell, a Huguenot by descent, was born in Meaford, Ont. After graduating with honors in civil engineering, Capt. Latornell became city engineer of Edmonton, an appointment which he gave up early in 1916 to qualify for an overseas commission.

Henry J. Fuller, president of the Canadian Fairbanks-Morse Co., has been elected president of E. & T. Fairbanks & Co., of St. Johnsbury, Vt. The election of Mr. Fuller to this office will unite more closely the Canadian and American organization. Mr. Fuller is also a director of the Canadian Bank of Commerce, the National Trust Co. and other industrial concerns in the Dominion. Although born in St. Johnsbury, Vt., Mr. Fuller came to Montreal in 1897, two years after completing his education at Worcester Polytechnic Institute, and established a branch of the Fairbanks Co., which later developed into the Canadian Fairbanks-Morse Co., of which he is now the chief executive.

TRADE GOSSIP

Aikenhead Hardware, Ltd., are now distributors for Canada of the Simplex two-speed chain hoists manufactured by J. G. Speidel, Reading, Pa.

November Fire Loss.—The "Monetary Times" estimate of Canada's fire loss during November is $959,059, as compar-

ed with the October loss of $704,605 and $923,235 for November of last year.

U.S. Steel Corp. Unfilled Orders.—Unfilled orders of the United States Steel Corporation on Nov. 30 last were 8,897,106 tons according to the monthly statement issued last Monday. This is a decrease of 112,569 tons compared with the orders on October 31.

Japan Needs Steel Plates.—Japan cannot continue much longer to aid the Entente Allies with shipping unless permitted to import steel plates from the United States, Baron Megata, head of the special Japanese finance commission, said at a dinner given by Japanese bankeds in New York recently.

Firm Changes Back to Old Name.—The directors of the International Engineering Works, Ltd., Amherst, N.S., have decided to change the name of the concern to Robb Engineering Works, the former title. A meeting of shareholders will be held in Montreal on Dec. 19 to confirm this arrangement.

First Train Over Quebec Bridge.—The first freight train crossed the Quebec Bridge on Dec 3, composed of eighteen cars. The total weight of the train was 1,245 tons and it was just the length of the central span. When the full weight of the train was on the span the deflection of the structure was only 5/16 inch.

S.S. Turbinia for Overseas. — The steamer Turbinia has been sold at a reported price of $300,000 and is now being overhauled in preparation for trans-Atlantic service. She was the first steamer of the turbine type to be operated on the Canadian lakes, and was built in Glasgow, Scotland, at a cost of $220,000.

To Build Shell Plant.—Negotiations have been completed between the chamber of commerce of Batavia, N.Y., and a Canadian interest for the establishment of a shell factory in that city. The Canadian company, which has secured a contract from the United States Government for shells, plans to have the new plant operating about January, 1918.

The Dominion Bridge Co., Montreal, have obtained a controlling interest in the International Engineering Co., Amherst, N.S., and will carry on the business as a subsidiary. It is understood that the Dominion Bridge Co. have secured contracts for steam turbines and boilers in connection with the marine end of the business.

Montreal, Que.—At the annual meeting of the Mechanics' Institute held at Montreal recently, it was decided to begin the erection of the new building on the site purchased on the corner of Atwater avenue and Tupper streets, next spring. The building will include a reading room, library, lecture room, class or club rooms and a smoking room. The bulding, fully equipped, will cost in the neighborhood of $100,000.

Heavy Copper Contracts.—Contracts being placed by United States Government for copper are reported as enormous, and the trade has figured that approximately 90 per cent. of the available supply is being taken for war purposes. Regular consumers are still endeavoring to get their orders booked but dealers are fighting shy of agreeing ev. tentatively to make deliveries.

U.S. Price-Fixing Power.—Early enactment of legislation extending the United States Government's price-fixing power is expected by administration officials to follow President Wilson's declaration in his message to Congress that authority in this respect is now too limited. The feeling has been growing here that more power is needed to keep down rising prices; and industry, speaking through the Chamber of Commerce of the United States, has declared for the widest possible powers for the Government in this respect.

Grecian Magnesite Exports in 1916.—Magnesite exports of all grades from Greece in 1916 are given as 176,383 tons. Of raw magnesite the United Kingdom took 60,511 tons; the United States, 56,504 tons; France, 24,607 tons; Italy, 3,100 tons; the Netherlands, 320 tons. Of the caustic and calcined mineral the United Kingdom took 13,127 tons, the United States 9,514 tons, and the Netherlands 730 tons. Of the dead burned grade, the United Kingdom took 3,975 tons and France 3,462 tons.

Lake Superior Ore Shipments.—A record for the month of November in the movement of ore from the Lake Superior district was established last month, when the cargo carriers on the lakes loaded 7,331,804 tons, according to figures just issued. This is an increase over November, a year ago, of 1,616,351 tons, and brings the season's total to December 1, up to slightly more than 61,500,000 tons. The season's total, however, is approximately 2,000,000 tons less than for the same period last year.

Production of Explosives in U.S.—The production of explosives in the United States during 1916 was in excess of 500,000,000 pounds, an increase of about 44,000,000 over 1915. The total included 215,575,615 pounds of black powder, 253,154,780 pounds of "high" explosives other than permissible explosives, and 34,685,240 pounds of permissible explosives. The value of the exported explosives, which in 1914, the first year of the war, were valued at about £2,000,000, reached a total value in 1916 of some £144,000,000.

Four Steamers Ordered.—The first war order to come to Vancouver since the floating of the Victory Loan is, by coincidence, for $7,254,000, almost exactly the amount of the city's contribution to the loan issue. The contract came from the Imperial Munitions Board to Coughlan's, Ltd., and provides for the construction of four additional 8,800-ton steel freight steamers, turbine propelled, similar to the six already under construction in the yards. The Coughlan yards have now building contracts to the value of more than $15,000,000.

Coal Shipments on Lake Superior.—The up-lake coal movement to December 1, was 25,855,737 tons, or 1,938,675 tons greater than for the corresponding 1916 period. Coal movements have virtually ceased, but the year's total likely will exceed 26,000,000 tons. Abnormally heavy uplake coal movement offers a partial explanation for the shortage which prevailed in eastern Ohio and western Pennsylvania industrial districts for months past, greatly crippling operations and reducing the iron and steel output. Coal movement virtually stopped on Dec. 1.

Big Harbors Needed When War Over.—Improvement in sea transportation was discussed at the London, England, Chamber of Commerce, on Dec. 5, when Lord d'Abernon emphasized the need of bigger ships of great speed after the war. He suggested the government should start the provision of big harbors. About $20,000,000 would provide for vessels of 38-foot draught at practically all the leading harbors from Great Britain to the furthest dominion. The report of the Dominion Royal Commission just issued gives memoranda and tables as to harbors throughout the Empire.

Traffic Heavy at the Soo.—Freight shipments of all kinds through the locks at Sault Ste. Marie in November totalled 11,154,508 tons which is a new traffic record for that month. The figures have just been made public by the United States engineer's office. They show a heavy movement of grain, wheat shipment totalling 37,992,913 bushels. Flour shipments eastward amounted to 1,293,410 barrels. Shipments of soft coal through the locks for the month amounted to 1,685,586 tons; hard coal 332,210 tons. The figures on iron ore show a movement of 7,214,058 tons. Vessel passages through the locks for the month totalled 2,772.

Forest Survey in Ontario.—The Commission of Conservation hopes soon to undertake a survey of the forest resources of Ontario, similar to the investigations it has already made in British Columbia and Saskatchewan. Only the most fragmentary data respecting the forests of Ontario are now available, although there is a vast amount of detailed information in the possession of timber owners, Government officers and railways, which could probably be secured. The commission is handicapped in undertaking such an investigation by the scarcity of competent foresters. Last year at the height of the fire season its staff consisted of about 1,000 men.

Manganese Ore Prices.—Indian manganese ore has sold recently in the United States as high as $1.30 per unit, seaboard, for high-grade material. Brazilian ore has been quoted at $1.10 to $1.20 per unit, seaboard. For domestic ores a leading dealer is now offering the following prices: $1.20 per unit for ore containing 50 per cent. or more manganese; $1.10 per unit for ore averaging 46 to 49.99 per cent.; $1 per unit for 42 to 45.99 per cent. ore, and 90c per unit for 38 to 41.99 per cent. ore. For all these grades

If interested, tear out this page and keep with letters to be answered.

maximum limits of 10 per cent. silica, 0.20 per cent. phosphorus, and 3 per cent. iron are stipulated.

British Need More Iron Ore.—Sir John Ferguson at the last meeting of Bolckow, Vaughan & Co., made a most interesting statement concerning iron ore. He thought the iron and steel manufacturers of Great Britain might, with advantage to themselves and to the national trade, act together in securing the control of some of the undeveloped deposits of iron ore, and he suggested that the Government interest itself in the matter. There are very large deposits in Brazil which from a national point of view should be secured for future use.

Dominion Resources Directory.—The first comprehensive and authoritative directory of Canada's natural resources is to be published without delay by the Commission of Conservation. Sir Clifford Sifton, the chairman, gave the first intimation of this at the annual meeting of the Commission last week. Inventories of the various sections of the country will be arranged, and published geographically, provinces having similar resources being grouped together. One division, for instance, will cover the Maritime Provinces, another the Prairie Provinces, another Ontario, etc. The information to be published, it is believed, will be of the utmost importance in the solution of after the war problems.

Shortage of Hydro Power.—The increasing shortage of hydro power has prompted the Hydro-Electric Commission of Ontario to develop an additional 45,000 h.p. at the Ontario Power Co's. plant at Niagara Falls. It is expected that this will relieve the situation until the Chippewa Creek development is in operation. The Chippewa development will furnish 300,000 horse-power and will cost something in the neighborhood of $23,000,000. The Western Ontario natural gas, which has been providing the motor power for many important industries, is falling down, and unless these people can get Hydro power several flour mills will have to suspend operation. Several companies are appealing to the Hydro to help them out now that they can't get natural gas.

Magnesite Production in 1916.—Normally about 6 lbs. of magnesite was formerly used for every ton of steel made by the basic open-hearth process. but now not more than ½ lb. is used, and at some steel plants cheaper and less satisfactory refractories have been substituted, says Hoyt S. Gale in a U. S. Geological Survey Bulletin 666-BB on "Magnesite." More raw magnesite was produced in the United States in 1916 than ever before. Last year's output was 158,759 net tons as compared with 30.499 tons in 1915 and 9.632 tons in 1913. Imports for consumption of the raw mineral were 75,345 tons in 1916, also exceeding any previous record, but the imports of calcined magnesite were only 9.270 tons as compared with 167.094 tons in 1913. The total consumption calculated as calcined mineral in 1916 was 126,322 tons as compared with 66,706 tons in 1915 and 178,530 tons in 1913.

The International Business Machines Co. has been launched with a capital of $2,000,000. The new concern will take over the plants and stocks of the International Time Recording Co. and the Computing Scale Co., both Toronto concerns, and the Canadian Tabulating Machine Co., of Montreal. The operations of this latter concern will be at once transferred to this city. By bringing these three companies together a great saving in the cost of management and operation will be effected. Thomas J. Watson will be the president of the new combination, and F. E. Mutton the vice-president and general manager. J. S. Ogsbury is the secretary. L. A. Davidson has been appointed sales manager for the scales division and St. George Bond, of Montreal, will have charge of the tabulating section. The company has $100,000 in cash available for immediate expansion.

Entertained Employees. — The employees of the Hall Engineering Works, Montreal, were recently given a dinner by the directors of the concern at Cooper's restaurant, there being about one hundred persons present. Toasts were given and a musical programme provided. A toast to the employees was proposed by T. Fisher, and responded to by W. F. Fletcher, director, and Wm. Forbes. In the course of the remarks it was evident that a fine spirit existed between employers and employees. A toast to the army, navy and mercantile marine was proposed by W. S. Johnson, and responded to by Lt. Matthews and Capt. Reed. Other toasts were "Our Guests," proposed by Thomas Hall, president of the company, and responded to by Thomas Arnold, and "Our President," proposed by F. H. Fox, secretary-treasurer.

Included among the guests from outside were Mayor Ballantyne, of Montreal West; Messrs. C. W. Baker, Geo. G. Fox, W. S. Johnson, C. A. Bishop, W. Stewart, D. J. S. Tyrer, Lt. Matthews, Geo. Wood, W. Graveley, W. J. Alderson, and Capt. Archibald Reed.

TENDERS

Toronto, Ont.—Tenders will be received, addressed to the Chairman, Board of Control, City Hall, Toronto, up to January 15, 1918, for the construction of a drainage system (wrought iron pipe) for the Don Bridge, Bloor Street Viaduct. Specifications and forms of tender may be obtained upon application at the Bloor Street Viaduct Field Office, 89 Castle Frank Road.

Ottawa, Ont.—Tenders will be received until December 17 for the electric conduits, outlets and fittings required in the reconstruction of the Parliament Building. All tenders to be based on the supplying and delivering on the site of the quantities of the schedule of material for electric conduit, outlets and fittings, in strict conformity with the specifications and the samples submitted and to the satisfaction of the architect. Deliveries to commence so far as possible immediately after the signing of contract and to continue as directed in such quantities as to ensure complete delivery by March 1, 1918. The schedule of material, specification and any other information required can be obtained at the office of the P. Lyall & Sons Construction Co., Ottawa.

MARINE

Victoria, B.C. — The C.P.R. steamer Princess Ena is again in commission after an overhaul at the Victoria Machinery Depot, and has left for the North. The Princess Royal will resume service at the end of the week.

Sarnia, Ont.—The Imperial oil tanker Royalite has arrived here from up lake ports and will go into winter quarters at once. The crew reports that it encountered floating ice in Lake Hurton.

Hantsport, N.S.—The Noel Shipbuilding and Transportation Co. now have under construction a 450 ton (net) schooner, 138 feet long with a beam of 35 feet and a 13 feet hold. This three-master was begun in October and will be framed by Christmas.

Victoria, B.C.—The Victoria Whaling Co. tender Gray, which has been undergoing repairs at Yarrows, Ltd., for the past month, has been turned over to the owners, and will begin at once loading empty oil drums for Sechart, Kyuquot and other West Coast stations.

Victoria, B.C. — The Cameron-Genoa Mills Shipbuilders, Ltd., have laid the keel for the fourth wooden steamer to be built at the Point Ellice yards to the order of the Imperial Munitions Board. This is the tenth keel to be laid by the company since it was established last spring, the other six being the auxiliary wooden schooners built for the Canada West Coast Navigation Company.

Victoria, B.C.—The Dominion fisheries patrol vessel Alcedo, which is at Yarrow's yards, has been hauled out on the slip for repairs to its keel, necessitated by the accident on November 27, when it ran aground in Houston's Passage, close to Cowichan Gap. The fishery vessel Restless has also been placed on the ways for general overhaul. Both vessels will probably be in the water again in the course of a week.

Victoria, B.C.—Announcement was made at the offices of the B. C. Coast Service of the C.P.R. recently that the fast passenger liner Princess Victoria has been withdrawn from service to be overhauled. A cracked tail-shaft, which has to be drawn and replaced, and run-down cylinders which have to be bored, are some of the things that will have to be given attention by the repair crew when the vessel goes on the ways. The entire machinery will undergo a complete overhauling, and it is expected that the job will occupy about six weeks.

New Westminster, B.C.—Although delayed at the start by a shortage of material, the New Westminster Construction and Engineering Co., which is building four wooden steamers for the Im-

GEOMETRIC DIE-HEADS

HERE'S a quartet of die heads that means death to threading trouble. They are worthy representatives of the Geometric family — among which can be found a Self-Opening Die Head or Collapsing Tap for any thread you could possibly want.

These tools can be adapted to any make of turret lathe or screw machine. Many manufacturers already make them standard equipment. We are convinced that the rest will, eventually; any Geometric user will tell you why.

The MacLean Publishing Co., Limited

143-153 University Avenue, Toronto, Ontario

perial Munitions Board at the Poplar Island yard, in fully confident of launching the first of them by Feb. 1, the date scheduled. The work is now progressing at a satisfactory rate. Planking is under way and the first of the hulls is nearly ready for the beams. The second hull is about ten days behind the first, and will probably be launched about a week later while the third will come on shortly thereafter. The keel of the fourth boat is laid and the sternpost set up.

Vancouver, B.C.—The John Coughlan Co. have been offered a contract for four steel steamers by the Imperial Munitions Board. The four vessels would be identical in construction with five now being built for the Imperial Munitions Board in the Coughlan yards here. These vessels are valued at $1,250,000 each, so that if four more are added to the fleet, it will mean an additional $5,000,000 worth of ships for this city. The Coughlan programme at the present time represents between $7,000,000 and $8,000,000. With the addition of the new contracts, approximately $13,000,000 worth of shipping will be turned out of these yards within the next year or two. The vessels will be of 8,800 tons and of the same type as the Luis Nielsen and the Niels Nielson, launched at Seattle yards this year.

CONTRACTS

Hamilton, Ont.—P. H. Secord & Son, Brantford, have been awarded the contract for factory addition for the Frost Wire Fence Co., to cost $25,000.

Hamilton, Ont.—The general contract for an addition to a factory for the Canadian Shovel Co. has been given to George E. Mills, Hamilton, at $25,000.

Galt, Ont.—P. H. Secord & Son, Brantford, have the general contract and the Hamilton Bridge Works Co., Hamilton, the steel contract for $30,000 addition to foundry for the Canada Machinery Corporation.

INCORPORATIONS

Eastern Chemical Co. has been incorporated at Ottawa with a capital of $200,000 to manufacture pumice stone and chemicals of all kinds. The head office is at Montreal, and the incorporators are J. O. Dion, J. W. Pion, and A. Coutant, all of Montreal.

British Molybdenite, Ltd., has been incorporated at Ottawa by Kenneth McRae, Cecil E. Dillistone, and Charles W. Milburn, all of Toronto, to own and develop mineral deposits and treat ores of all kinds. The head office is at Toronto, and the concern is capitalized at $100,000.

International Business Machines Co. has been incorporated at Ottawa by Frank E. Mutton, Edmond B. Ryckman, and John S. Denison, all of Toronto, to manufacture all kinds of tabulating, recording and adding machines. The head office is at Toronto and the company is capitalized at $2,000,000.

WOODWORKING

Cobalt, Ont.—Fire on Nov. 30 destroyed the lumber mill at Moose Lake belonging to C. J. Price. The loss is estimated at $8,000; there was no insurance.

CATALOGUES

Brass and Copper Products.—The Tallman Brass & Metal Co., Hamilton, Ont., have distributed a stock list of brass and copper products, ready for immediate shipment. The product includes brass and copper rods, sheets, tubing and bars, etc.

Torsion Meter.—Catalogue describing and illustrating the Gary-Cummings torsion meter made by the Cummings Ship Instrument Works, Boston, Mass. This meter, which is used on ships for measuring shaft horsepowers, is described at length in regard to its construction, care and operation. The catalogue also contains an equation for calculating the horsepower and a calibration data sheet. The illustrations show the instrument in detail and also installed.

Cochrane Precision Meter.—Engineering Bulletin No. 21 deals with the Cochrane precision meter, volumetric type, made by the Harrison Safety Boiler Works, Philadelphia, Pa. A comprehensive description is given of the meter while reference is made to installations on United States battleships. Copies may be obtained on application from Canadian Allis-Chalmers, Ltd., Toronto, agents for Canada.

Industrial Motors.—The second of a series of catalogues of industrial motors has just been distributed by the Westinghouse Electric & Mfg. Co. of East Pittsburgh, Pa. This is known as catalogue 30 and covers the company's complete line of direct current motors and generators for industrial service. After several pages giving general information regarding the ordering, classification and selection of direct current motors there follows complete description, rating and dimensions for type SK commutating-pole motors, various modifications of type SK elevator motors, reversing planer motor equipment, type CD motors, headstock equipment for woodworking plants, type SK and CD motor generators and arc welding equipment. Much new information is given especially on such subjects as arc welding, headstock equipment, motion picture service and battery charging service. The new catalogue is identical in size and will fit the binder for the company's line of catalogues covering supply apparatus and small motors.

Arctic Explorer (recounting adventures of his last expedition. "We certainly could have reached the Pole had not our dogs given out at a critical moment."

Fair Listener (breathlessly): "Why, I thought that the Eskimo dogs were perfectly tireless creatures!"

Arctic Explorer (gloomily): "I—er—speak from a culinary view, madam."

Aikenhead's Wahlstrom

It has neither collets, sockets nor keys, and is undoubtedly the strongest, fastest positive drive automatic chuck for drilling, reaming, tapping and counterboring.

You Don't Stop Spindle

And waste minutes putting in or taking out the drill. In just two seconds you make tool changes, the Wahlstrom perfectly centering the tool automatically.

The Perfected Automatic Chuck

Holds No. 1, 2 or 3 Morse Taper Shank Drills, with or *without* a Tang. There's also a Wahlstrom for Straight Shank Drills.

USED MACHINERY IMMEDIATE DELIVERY

DRILLING MACHINES.

30" Lodge & Davis, S.H., B.G., P.F.
No. 0 Bickford Radial, tapping attachment.
4' Mueller Plain Radial.
Four No. 310 Baker Heavy Duty.
3-spindle Rockford.
4-spindle Rockford.
4-spindle Washburn, with power feed.
4-spindle Allen.
No. 11 Pratt & Whitney, 10 spindles.

GEAR CUTTERS.

24" x 7" G. & E., spur gears.
No. 3 26" B. & S., spur gears.
30" x 9" G. & E., spur and bevel gears.
36" x 9" G. & E., spur and bevel gears.
36" Walcott, spur gears.
No. 1 Schuchardt & Schutte Gear Hobber.

GRINDERS.

No. 1 Cincinnati Universal Tool and Cutter.
No. 1½ Cincinnati Cutter and Tool.
No. 2 Woods Tool and Cutter.
Brainard Cutter.
Leland Universal, with power feed.
No. 2 Landis Universal.
No. 6-A Diamond Universal.

LATHES.

10" x 5' LeBlond, C.R., with chuck.
14" x 6' Hamilton, C.R., chuck.
14" x 6' Rockford, C.R.
15" x 6' Rockford Tool Co., C.R.
15" x 6' Prentice Lathe, C.R.
16" x 8' Bradford, C.R.
18" x 6' Bradford, C.R., taper attachment.
18" x 8' Lodge & Shipley, pat. head, C.R., taper attachment.
20" x 14' Blaisdell, C.R.
21" x 12' New Haven, C.R.
24-27½" x 14' Lodge & Shipley, selective geared head, Q.C.G., 18" chuck fitted.
24-27" x 12' Reed-Prentice, geared head, single pulley drive.
32" x 12' Schumacher & Boye, 28" chuck, fitted.
36" x 18' Schumacher & Boye, T.B.G., Q.C.G.
36" x 20' American, T.B.G.

PLANERS.

24" x 24" x 6' American, one head.
26" x 26" x 8' Pease, one head.
36" x 36" x 8' Powell, 2 heads.
36" x 36" x 14' Sellers, one head.
39" x 39" x 12' New Haven, one head.

SCREW MACHINES.

No. 1 Warner & Swasey, plain head.
No, 2 P. & W., friction head.
No. 3 Pratt & Whitney, B.G., double friction head, A.C. and W.F.
No. 3 Bardons & Oliver, plain head, A.C. and W.F.
No. 4 Pearson, friction head, A.C. and W.F.
No. 5 Foster, geared friction head, A.C., P.F. to turret slide, and P.F. to cross slide.

TURRET LATHES.

No. 2 Foster-Kimball, plain head.
No. 22 Garvin, plain head.
16" Lodge & Davis, back geared.
16" Warner & Swasey, friction head.
2 x 24" J. & L., cone head.
24" Gisholt, 4¼" spindle hole, taper attachment.
No. 3-A Warner & Swasey, bar attachment.

PUNCHES AND PRESSES.

No. 2 Rockford, O.B.I.
No. 20 Thiem, O.B.I.
No. 3 Loshbough-Jordan, O.B.I.
No. 3 Loshbough-Jordan, O.B.I.
No. 4 Rockford, O.B.I.
No. 4 American Can., O.B.I.
No. 74½ Bliss, str. side, geared.
Blake & Johnson Embossing.

MISCELLANEOUS.

7'-10' Betts Boring Mill.
No. 2 Garvin Auto. Tapper.
No. 2½ Hendey Lincoln Type Miller.
No. 24 Oesterlein Universal Miller.
4" Nutter & Barnes Cutting-off Machine.
6 x 48" P. & W. Thread Miller.
No. 3 Cincinnati Vertical Milling Machine.
20 H.P. Nash 2-cylinder Vertical Gas Engine.
6 H.P. Fairbanks-Morse Horizontal Gas Engine.

Stocker-Rumely-Wachs Company, 117-121 N. Jefferson St., CHICAGO, ILL.

Complete 18-pr. Shrapnel Plant for Sale

PRINCIPAL ITEMS AS FOLLOWS:

1—Cutting-off Machine, with 15" three-jawed chuck.
1—Lathe, 28" swing, 8' bed.
1—Air Chuck, Double End Rough Turning Lathe.
1—Single End Rough Turning Lathe.
1—Single End Lathe, for base roughing.
1—Single End Base Facing Machine.
1—Double End Tool Grinder.
1—Jenckes Grinder.
2—Boring Machines, C.M.C., with turrets.
2—C.M.C. Lathes, equipped for nosing and tapping.
1—22" Davis Turret Lathe.
1—Jenckes Copper Band Lathe.
1—Gisholt Lathe, with 15" three-jawed chuck.
1—Lo-Swing Lathe for turning profiles.
1—Tool Grinder, 24" wheel.
1—Lathe, 14" swing, 6' bed.
2—Ford Smith Shell Grinders, complete.
1—17" LeBlond Lathe, equipped for wavy groove.
1—Drill Press, fitted for screwing in sockets.
1—16" Swing Acme Turret Lathe, for turning sockets, fitted with air chuck.
1—Double End Painting Machine, with ¼ h.p. motor.
1—Jenckes Air-operated Copper Band Press.
1—25 H.P. Canadian General Electric Motor, complete with starting box.
1—30 H.P. Westinghouse Motor, 550 volts, complete with starting box.
1—40 H.P. Canadian General Electric Motor, 2,200 volts, complete with starting box.
1—Westinghouse 40 H.P. Induction Motor, 550 volts, complete with starting box.
1—Nosing Press, for nosing shells.
1—6 H.P. Canadian General Electric Motor for same.
1—Hoskins Pyrometer.
1—Nose Furnace.
1—Tempering Furnace.

Jenckes Machine Co., Ltd.
Sherbrooke, Que.

FOR SALE

1—90' Thomas Spacing Table complete with indicator carriage, trolley carriage, stands, adjustable roller, racks, etc. Capacity: Plates, 48' long x 48" wide; angles, 8' long x 8" wide. Further particulars on application.

1—40 H.P. Horizontal Gasoline Engine complete and in running order.

1—30 H.P. Horizontal Gasoline Engine complete and in running order.

1—Air Compressor driven by Twin Cylinder Fairbanks Gasoline Engine. (Mounted).

Complete equipment for machining 4.5 H.E. Shell Nose Plugs. Capacity, 10,000 per day.

1—Powerful Hand Punching Machine.

1—Horizontal Steam Pump.

Machine Tools For Immediate Delivery

DRILLING MACHINES

No. 0 and No. 1 Burke Bench Sens. Drills.
No. 3 Barnes Horizontal Radial Drill.
No. 1-S Garvin B.G. Horiz. Drill with pump and piping.
Nos. 150, 151, 152 Buffalo Blacksmith Post Drills.
No. 1-B Henry & Wright H.S.B.B. Drills, 8" overhang.
No. 2-B Henry & Wright H.S.B.B. Drills, 8" overhang.
14" Royersford Sensitive Drill.
No. 7 15" Barnes Drills with tappers.
No. 5 20" Buffalo Drill with power feed.
No. 102 Harrington S.S. Drill with elev. table, oil pump and piping.

GRINDING MACHINES

Geometric Chaser Grinder.
No. 2 Oakley Universal Cutter and Tool Grinder.
No. 2, No. 4, No. 6 Gardner Pl. Bearing Disc Grinders.
No. 2 and No. 3 Blount Double End Emery Grinders.
No. 3 Gardner B.B. Polishing Lathe, type "B."
No. 2 Diamond Auto. Surface Grinder, belt driven.
No. 3 Wilmarth & Morman Auto. Surface Grinder.
14" Blount Wet Tool Grinder.

LATHES

No. 5½ Sloan & Chace Precision Bench Lathe.
12" x 5' Style "E" Seneca Falls Engine Lathe.
14" x 6' Monarch Q.C., D.B.G. Engine Lathe with taper attachment.
16" x 7' Oliver Q.C., D.B.G. Engine Lathe with oil pump equipment.
17" x 6' Wickes Single Purpose Lathe with pl. rest and countershaft.
17" x 8' Sidney Q.C., D.B.G. Engine Lathes complete.
13" x 5' Blount Speed Lathe.

MISCELLANEOUS

No. 4 Porter-Cable Milling Attachment.
No. 6 Whitney Hand Miller.
No. 1 Standard Hand Miller with oil pump equipment.
Wisconsin Hand Miller.
No. 21 Garvin Plain Geared Miller.
Fischer Oil Groover.
Atlas Arbor Presses, all sizes.
Greenerd Arbor Presses, all sizes.

MACHINE TOOLS—Take Your Pick Now

BORING MACHINES—Vertical.
2—32" Bullards, 1 turret head.
1—37" Baush, 2 heads.
1—37" Bullard, 2 heads.
1—42" Baush, 2 swivel heads, quick change.
1—42" Bullard, two swivel heads.
2—10' Niles, 2 swivel heads.

BORING MACHINES—Horizontal.
1—2½" bar, Niles.
1—No. 2 Barrett, 5" bar.

BULLDOZERS.
1—No. 2 Williams & White, 16" stroke.
1—No. 4 Ajax, 20" stroke.
1—No. 9 Williams & White, belt drive.
1—No. 12 Ajax, single pulley drive.
2—No. 23 Williams & White, belt drive.
1—No. 26 Williams & White, belt drive.
1—No. 29-U Williams & White, arranged for motor drive.

CRANES—Traveling.
1—8-ton Chisholm & Moore, 13½' span, hand power.
2—10-ton Electric, 47' span, 25' lift, 3 motors.
1—10-ton Toledo, 3 motors, 30' span.
1—10-ton Whiting, 48' 8" span.
1—10-ton Whiting, 3 motors, 24' span.

CRANES—Locomotive.
3—10-15-ton McMyler Broad gauge Steam Locomotive, 60' boom, bucket, 3 drums.
1—15-ton Browning, 8-wheel, 38' boom.
1—15-ton Brown Hoist Locomotive, 36' boom, bucket, 8 wheels.
1—20-ton Orton & Steinbrenner, steam locomotive 8-wheel, double drum, 37' boom, bucket.
1—20-ton Brown Hoist, 8 wheel, 40' boom, bucket.
1—20-25-ton Industrial, 8 wheel, 50' boom, bucket.
1—25-35-ton McMyler, 8 wheel, 70' boom, bucket.

CUTTING-OFF MACHINES.
1—4" Hurlburt & Rogers.
30—4½" Davis.
10—4½" Williams.
1—5" Hurlburt & Rogers.
6—8" Automatic.

DRILLING MACHINES—Radial.
3—NEW 3' Mueller, speed box drive; January del.
3—NEW 3' American, Sensitive, tapping attachment.
1—4½' Full Universal, cone drive.
1—NEW 5' Western Plain, with motor.
3—NEW 5' Mueller, speed box drive; January del.
2—6' Reed-Prentice, latest type, belt driven; January del.
1—NEW 6' Triumph, motor drive; January del.

DRILLING MACHINES—Heavy Duty.
2—D-2 Colburn Heavy Duty, 3½" cap., arranged for motor drive.
4—No. 25 Foote-Burt, heavy duty, 2½" capacity.
10—No. 310 Baker, single pulley drive, late type, arranged for motor drive.
10—Moline Hole Hogs, heavy duty, 2½" cap.

DRILLING MACHINES—Sliding Head.
2—NEW 25" Cleveland, heavy duty.
5—NEW 28" Sibley.
2—NEW 30" Sibley.
2—NEW 34" Barnes.

DRILLING MACHINES—Multiple Spindle.
1—4-spindle 20" Barnes, all geared.
1—No. 5 Fox, 12-spindle, 1" capacity.
2—6-spindle Rockford; Economy type.

GEAR CUTTING MACHINES.
1—No. 1 Schuchardt & Schutte Gear Hobber, spur and bevel.
3—No. 3 Brown & Sharpe Auto Gear Cutter, spur.
1—36" Newark.
1—36" Whiton, for spur gears.
2—36" x 9" Gould & Eberhardt, new type, spur gears.
1—NEW 6" Standard Gear Cutter, spur.
1—15" Gleason Bevel Gear Planer.
1—20" Grant-Lees Gear Hobber, bevel spur and spiral attachment.
1—36" Fellows Gear Shaper.
1—28" Rhemania Gear Hobber, spur and worm gears.
2—NEW 30" Flather, solid pattern.
1—NEW 37" Gleason Gear Bevel Planer; Feb. delivery.
1—72" Gould & Eberhardt, spur and bevel.

GRINDERS—Universal for Cutters, Drills, Reamers, Etc.
5—NEW No. 190 Wells.
2—No. 1 Cincinnati.
1—NEW Gisholt Universal.
1—NEW Premier, Universal.
1—NEW Wilmarth & Morman, style B.K.
1—NEW Walker No. 1, outfit B.
1—NEW Walker No. 2, outfit K, capacity 9"x26".
2—NEW No. 2 Oesterlein Universal.

GRINDERS—Cylindrical. Plain.
3—NEW 8" x 30" Modern Self-contained.
2—NEW 12" x 24" Modern Self-contained.
4—12" x 36" Modern Self-contained.
2—12" x 42" Landis Self-contained.
5—12" x 48" Modern Self-contained.
1—12 x 66" Landis.
1—NEW 16" x 48" Landis, crank shaft.

GRINDERS—Cylindrical. Universal
3—NEW No. 1½ Landis, 10 x 30 capacity.
1—NEW No. 2 Walker; 9" x 26".
1—NEW Thompson 10 x 36".
1—12 x 36" Cincinnati.
1—No. 4 Cincinnati; capacity 12 x 72".

GRINDERS—Internal
1—No. 75 Heald.

GRINDERS—Disc.
1—NEW No. 4 Gardner, including disc press, 23" disc.
3—No. 14 Besley, including ring, wheel, chucks.
1—NEW No. 17 Gardner, 30" disc.

GRINDERS—Cylindrical.
1—No 60 Heald, single pulley drive.

GRINDERS—Surface.
4—NEW No. 1 La Salle Plain, with Micro. Adj.
1—NEW No. 1½ Walker's, complete.
4—NEW No. 2 Reid (Same as B. & S.).
1—3' Pratt & Whitney Vertical, Magnetic Chuck.
12—Carrigus type, mag. chuck.

HAMMERS—Board Lift Drop.
3—300-lb. McWilliams.
1—No. 4 Standard Machinery Co., 400-lb.
1—E. W. Bliss, 800-lb.
1—1500-lb. Toledo.
1—3000-lb. Williams & White.

HAMMERS—Steam Forging.
1—600-lb. Niles, single frame.
1—1500-lb. Niles.
1—7000-lb. Morgan Special Double Stand.

KEYSEATERS.
1—No. 1 Catlin.
1—Colburn 4", capacity 43" stroke.
1—No 2 Knowles, 60" stroke.

LATHES—Manufacturing, not Screw Cutting
2—NEW No. 3 Harding Brothers, Bench Lathes.
1—16" x 6' Prentiss, geared head, quick-change, taper attach.
70—NEW Simplex 16" x 8'.
14—Reed-Prentice Shell Lathes for 4" or 18-lb. American Shells.

LATHES—Engine.
3—NEW 16" x 6' Cleveland Tool Room Lathes, complete equipment.
1—NEW 17" x 8' National Quick Change, Double Back Gears.
10—17" x 6' LeBlond, heavy duty, auto. type, not screw cutting.
12—NEW 17" x 8' LeBlond Pan Bed, Quick Change Gears.
1—18 x 8 Prentiss, geared head, taper attachment, quick change.
3—20 x 8 Lodge & Shipley, quick change, turret on ways.
1—NEW 2 " x 10' Cleveland Geared Head.
2—20" x 10' Lodge & Shipley, quick change.
19—NEW 21" x 10' Porter, S.B.G.
7—22" x 10' Putnam, oil pan and pump.
1—NEW 24" x 10' American, high duty, quick change.
2—24" x 10 Lodge & Shipley, quick change.
1—24" x 10' Schumacher & Boye, quick change, taper attachment.
1—NEW 26" x 48" x 12' McCabe Double Spindle.
1—NEW 26" x 48" x 22' McCabe Double Spindle.
1—NEW 26" x 14' Bridgeford pattern, geared head, heavy pattern.
3—27" x 12' Bridgeford Heavy Duty, plain turning, 2 carriages, motor driven.
7—28" x 12' Bridgeport, geared head, heavy duty, taper attachment.
1—NEW 3 " x 14' American Double Back Geared. Quick Change.
1—30" x 14' Lodge & Shipley Single Pulley Drive. Quick Change.
1—NEW 36" x 12' Pittsburg Pattern.
1—36" x 13' Putnam, face plate drive.
1—36" x 17' Pond, triple geared, quick-change.
1—36" x 16' New Haven, quick change.
1—36" x 20' American, triple geared.
6—40" x 18' Pittsburg, quick change, gear, face plate drive.
1—54" x 22' Worcester, Triple Geared.
1—58" x 18' 6" Dodge Lathe, Very Heavy.
1—NEW 66" x 46 Putnam Triple Geared, Face Plate Drive, 5-step Cone; 6½" belt.
1—84" x 18' Special Boring Lathe.

LATHES—Turret.
8—NEW 21" Gisholt H-21.
2—21" Gisholt, 18" chuck, quick traverse, taper attachment.
5—2 x 24 Jones & Lamson.
1—NEW 18" Libby.
3—24" Libbey, Universal Facing Head, 3-jaw chuck.
18—6A Potter & Johnson.
1—NEW 3¼" x 4" Greenlee.
1—24" Brown & Sharpe Vertical, chucking mach.
1—24" Davis.
1—No 24 New Britain, arranged for motor drive; almost new.

MILLING MACHINES—Knee Type, Universal.
1—No. 2 Kempsmith, Vertical Attachment.
1—No. 2 Kempsmith 13" Dividing Head.
1—NEW No. 2 Kempsmith.
1—No. 1½ Cincinnati.
1—NEW No. 2 Rockford High Power.
2—NEW No. 2 Garvin.
3—No. 2 Cincinnati.
1—No. 2 LeBlond.
2—NEW No. 3 Cincinnati High Power; Jan. del.
1—NEW No. 3 Kempsmith.
1—No. 25 Oesterlein.
1—NEW No. 34 Oesterlein Heavy Duty; latest type.

MILLING MACHINES—Knee Type, Plain.
1—No. 0 Cincinnati.
1—NEW No. 2B Brown & Sharpe, heavy type.
1—NEW No. 2 Rockford.
1—No. 2 Cincinnati.
1—No. 3 Cincinnati, single pulley drive.
1—No. 3 LeBlond.
1—NEW No. 3 Cincinnati.
2—No. 3 Kempsmith.
1—No. 15 Garvin.

MILLING MACHINES—Thread.
4—Morris-Thompson, arranged for motor drive.
10—No. 3 Lees-Bradner.
5—No. 3C Lees-Bradner, for 9.2" English shells.
2—Archdale, Taft, Pierce, for 6" English shells.

MILLING MACHINES—Hand.
1—No. 1 Bickett.
3—NEW No. 2 Pratt & Whitney.
2—NEW No. 3 Garvin.
10—NEW Becker, table 20" x 5½".

MILLING MACHINES—Vertical.
1—No. 2 Cincinnati, latest type with circular table; as good as new.
1—No. 2 Pratt & Whitney.
1—No. 3 Cincinnati Heavy Duty.
1—No. 3 Ingersoll.
2—NEW No. 4B Becker.
3—NEW No. 5-B. Becker; Rotary Table.
1—Newton Vertical, Continuous, Motor Driven, for shell work.

MILLING MACHINES—Planer Type.
1—No. 2 Beaman & Smith.
1—Ingersoll Slab 16" x 48" capacity.
1—NEW 17" x 5' Eynon Planer Type.
1—22" x 22" x 5' Ingersoll.
1—24" x 24" x 12' Bement & Niles.
1—30" x 30" x 8' Ingersoll No. 928, Single Spindle with Motor.

MILLING MACHINES—Lincoln Type.
2—Briggs type, high duty.
3—NEW No. 4 Sterling.
14—No. 7 Becker.

PLANERS.
1—24" x 12' Detrich & Harvey, open side, one head, also milling attachment.
1—25" x 8' Detrich & Harvey, open side, good as new, one head.
1—26" x 26" x 10' Gray, one head.
1—36" x 36" x 10' American; 2 Heads.
1—36" x 30" x 12' Detrich & Harvey, open side, 3 heads.
1—36" x 36" x 14' Pond; one head.
1—36" Rotary Planer, Motor Driven.
1—36" x 36" x 8' Gray; One Head.
1—42" x 36" x 14' American, 2 heads.
1—42" x 42" x 12' Butler, high speed, 3 heads; almost new.
1—48" x 48" x 12' Scott; Heavy Type; Milling Attachment, on Rail.
1—60" x 60" x 16' Betts; 2 Heads.
1—60" x 60" x 21' Pond; 3 Heads.
1—62" x 62" x 20' Canada Tool Works Planer; 2 Heads.
1—72" x 60" x 14' Smith Globe; 2 Swivel Heads.

PUNCH AND SHEARS.
1—Waterbury-Farrell Alligator Shears, cap. 2½".
1—Cincinnati Gap Shears, 17" gap, 78" blade, ¼" capacity.

Machinery and Plant for Sale

LOCATION, BRITISH COLUMBIA

Plant completely equipped for manufacturing frogs and switches.

Equipment may be bought independent of plant.

Specifications: Modern Building, 100' x 200' on 7½-acre site. Ideal wharfage and C.P.R. spurs running into plant.

PRINCIPAL EQUIPMENT

MACHINERY

1—18" Barr Double Arm Punch and Shear.
1—26" Prentice Drill Press.
1—40" Buffalo Blower.
1—5' Bellers Radial Drill.
1—2-ton Chain Block and Swedge Block.
1—48" Espen Lucas Cold Saw, 2 blades.
1—72" x 72" x 14' Enterprise Planer, 2 heads and grinder head.
3—Air Hoists, 1 4', 2 7'.
1—2" Acme Bolt Cutter, 3 complete sets of dies.
1—12 x 12 Rand Steam-driven Air Compressor, with tank.
1—36" x 36" Niles Planer, with two heads.
1—45" x 12' Niles Two-head Planer, with extensions.
1—54" Putnam Gear Cutter, with cutters.
1—Gisholt Tool Grinder.
1—32" x 48" Brainard Slab Miller.
1—Power Hack Saw.
1—1½" Spindle Double-end Grinder.
1—48" Morton Draw-cut Shaper.
1—1210A Mason Boiler (T.P. 240, W.P. 160).
1—Dudley Car Frame and Trucks.

"PURO-FY"

(MADE IN CANADA)

THE American Museum of Safety conferred a Gold Medal Award upon the Puro Sanitary Drinking Fountain at the First International Exposition of Safety and Sanitation.

The Puro Sanitary Drinking Fountain won because it deserved to win—Puro had merits that made it stand head and shoulders above any other drinking apparatus.

Safe Simple
SANITARY Economical
Quickly Attached

These are the qualities that forced the leading safety and sanitary engineers to pick Puro in preference to all others.

No device can be as efficient that does not contain all these qualifications; and Puro was not tied for first place; Puro was first.

Don't be satisfied with half-way goodness, or makeshift drinking arrangements for your employees.

If the men in your factory must drink, give them a clean drink.

Puro is clean—it does not rust or corrode.

Puro is economical. It allows just the proper amount of cool, clean, fresh water to come through the bubbler. No spurting, no overflowing, no loss. Puro regulates itself. You can attach it in five minutes.

Tell us how many men in your factory and your water pressure in pounds—

We'll tell you just what it will cost to "PURO-FY" YOUR WATER SUPPLY.

NO DRAGGING BACK ON THE NON-CUTTING STROKE

To protect users of Racine High-Speed Metal-Cutting Machines, we carry a large stock of the famous Racine H.S. Tungsten Blades.

A patented device of this Racine High Speed Metal Cutting Machine automatically lifts the blade clear of the work on every return stroke.

In this feature alone the Racine increases both output and endurance of the blade 500 per cent.

Therefore time saved—blades saved—would soon return to your pocket the reasonable cost of a Racine.

This fact—because it is a fact—could be proved to your satisfaction if you'd let us send you names of Canadian plants using Racines—one Montreal plant is using 168 — or if you'd let us ship a Racine on trial terms that you consider fair.

Write us to-day.

RACINE TOOL & Machine Co., 15 Melbourne Ave., Racine, Wis., U.S.A.

The New "West" Banding Press

For 9.2" and 8" shells

12 Cylinders; Ample Power; Ample Strength; Reasonable Price.

NO ACCUMULATOR REQUIRED.

The West Tire Setter Co.

255 Mill Street, Rochester, N.Y.

DON'T be governed by World-Wide Reputations and Previous Records in selecting your next Cutting-Off Equipment. The NEW IMPROVED PEERLESS High Speed Heavy Duty Metal Cutting Saw has completely revolutionized and upset all metal cutting standards.

This statement is based entirely upon the reports and repeated orders received from concerns that had heretofore used tools such as referred to.

To induce investigation we will gladly ship one for a comparative test. If you do not consider it the best and most profitable tool you have ever purchased, you are under no obligations to keep it, and we will stand the freight charges both ways.

Would you like to see a list of large manufacturers that are continually repeating their orders? We have it ready for you.

PEERLESS MACHINE CO. 1607 Racine St. RACINE, WIS., U.S.A.

Better Cut Gears

Hamilton cut gears are better than ordinary gears, for they are the product of a highly specialized gear-cutting organization with years of experience behind it.

Let our engineering department help you solve your gear problems.

Hamilton Gear & Machine Co.

Van Horne Street - TORONTO

You Don't Like to Shave with a Blunt Razor

—It tries your temper and spoils your skin.

Then don't expect your men to file with blunt files.

It makes them *grouchy* and spoils *your* work.

That costs *you* money any way you look at it.

Give your men "Famous Five" files to work with, and you'll get good results; because "Famous Five" files are hard, sharp and retain their keen cutting qualities for the longest time.

Remember this and specify them when ordering. They are:

MAKE NAILS! NOT NOISE!

We offer the trade new types of

WIRE NAIL MACHINES

QUIET IN OPERATION; WITH VERY HIGH OUTPUT; ALL PARTS ACCESSIBLE; DECREASED MAINTENANCE COSTS; GREAT CAPACITY; OCCUPYING SMALL FLOOR SPACE.

Smoothly running machines, with balanced mechanical motions and no rotating cams. Built in 5 sizes, handling wire from No. 17 to ⅜" diam.

PRACTICALLY NOISELESS IN OPERATION

Circulating Pumps

Eliminate the separate relief valve and its necessary piping by installing the Roper Circulating Oil Pump. But, you say, why install a new system when the present is good enough? This "good enough" article may appear to be giving satisfaction, *but,* is it giving the best to be obtained. Can you speed up without any fear? With a Roper you need not have any fear of any kind. The oil flows from it in a steady, even stream, and there you can speed up to full capacity and let her go feeling confident.

Inquire. You will get valuable information anyway.

CHAPMAN

DOUBLE BALL BEARINGS

The ordinary line shafting consumes from 15 to 60 % of power developed—

But the line shafting that's equipped with Chapman Double Ball Bearing will save 75 per cent of the friction loads making an average total saving of power from 15 to 30 per cent.

Chapman Double Ball Bearings fit any adjustable hanger and the change can be made with but little delay to you.

Used in over 2,000 Canadian Factories. They have other good points too. Ask us to send full details.

The Chapman Double Ball Bearing Company of Canada, Ltd.
339-351 Sorauren Ave., TORONTO, Canada

TRANSMISSION BALL BEARING CO., Inc.
1050 Military Rd., Buffalo, N. Y.

Your Die Heads

are giving you the kind of threads you are now getting. Do you like them? Is the head consuming too much of your time, adjusting and repairing? H. & G. Automatic Self-opening Die Heads eliminate all that. The chasers are locked, and no stoppage or changing in size required. The quick release allows cutting to a certain point each time. It also permits cutting right up to the shoulder when necessary.

Our booklet will tell you all about it. Write for it, anyway; it is valuable to have around.

Eastern Machine Screw Corp.
New Haven, Conn., U.S.A.

H & G

IF self-interest be the mainspring of a man's actions, then you should act at once, because the "Clipper" Belt Lacer saves money for you.

Each time a belt breaks from 1 to 150 men and machines are idle.

"Clipper" lacings have been made in 45 seconds. The maximum time required is only three minutes. How long are *your* men and machines idle when a belt breaks?

Clipper Belt Lacer Company
976 Front Avenue Grand Rapids, Mich.

JACOBS

IMPROVED DRILL CHUCK

There is no "chuck reason" for poor holes or broken drills when this chuck takes hold. No wobbling—no slipping or chewing up of shanks—just "In Again—Out Again," leaving as clean a hole as the drill can make.

You can always depend on a Jacobs to back you up when you wish to try out some new, faster cutting drill. Give some a trial.

The Jacobs Mfg. Company
Hartford, Conn.

Handle 75-M/M Shells Just Once

Two Murchey Taps on your lathe completely finish this shell so that when it comes off the machine there is no more handling or re-sizing to do. Therefore

Murchey Tap Them

By using Murchey Collapsing and Adjustable Taps, you save two minutes or more on every 75-mm. Shell. Figure that in dollars for yourself!

Practically all the large plants of the United States are lining up with Collapsing Taps to thread the nose of this shell. No minute must be knowingly wasted.

Murchey Chasers are quickly adjusted to compensate for wear, and Murchey Adjustable Taps serve as long as ten solid Taps.

WRITE AT ONCE FOR ALL PARTICULARS.

Murchey Machine & Tool Company

Lightning Deliveries
—That is Murchey Service

"Each Operator Averaged 10 More Shells per Day"

In his report to plant owner the works manager quoted recommended disposal of all remaining screw-operated box chucks.

His report was made three months after a partial change to Hannifin Air Chucking.

Six weeks later every lathe in the plant was equipped with Hannifin Air Operated Chucks.

At this time Hannifin Air Operated Mandrels were also installed.

The plant in question is producing 6-inch shells.

It is nothing unusual for Hannifin Air Operated Chucking and Clamping Equipment to add an extra day in time saved to each week.

In many of the largest plants in this country and Canada, Hannifin Air Operated Equipment has increased output from 20 to 80 per cent. In a number of plants it has actually *doubled* output.

If your work requires quick handling and rigid never-slip grip, for you to do without Hannifin Air Operated Chucking and Clamping Equipment is to do without profits within your reach.

Say you would like our catalog.

If interested, tear out this page and keep with letters to be answered.

Cut Boring Expenses

ACTUAL TESTS under trying circumstances have proven that boring expenses may be cut in half by using the DIXON PATENT BORING TOOL. License to make this tool may be purchased outright. Get in touch with me.

C. L. DIXON

278 Old Orchard Ave., N.D.G., Montreal, Que.

EMBREE

TOOL CASES

Something New, Different and Better

Mechanics who have seen and used these new tool cases say they're the most serviceable yet introduced. Comprise five designs in oak or leather-covered.

Made of selected material, drawers have lock corners and oak cases are nicely dovetailed, a feature not found on most cases of other manufacture. Every mechanic should have one, as they are moderate in price. Write for price list.

IRA EMBREE, Hamilton, Canada

and Compound Table

For the Die Maker, Repair Shop, Pattern Maker or Garage; will perform more than 90% of the jobs that come up.

For any Drill Press, 14" to 42" swing. Big Economy — Big Convenience— Small Price. It relieves your large millers, comes in handy spotting castings, milling ends of bosses, and many other odd jobs. Cuts all kinds of keyseats perfectly; mills deep grooves, slots and cams. We also make cylinder reamers for reboring Ford car, and a reliable air compressor—all at special factory prices. Write for circulars to-day.

Hinckley Machine Works, HINCKLEY ILLINOIS

"FROST KING"

AN INTERNATIONAL FAVORITE

The popularity of "Frost King" is due to its efficiency and extraordinary performance under heavy duty and the way it takes care of high speed.

As an all-round babbitt "Frost King" is without a peer. Babbitt expenses will be materially reduced with its use.

Give it a trial and be convinced.

It Takes a Rugged Machine to Handle A Job Like This

NOTE the sturdy overhanging arm, arm brace and arbor support insuring the rigidity necessary for cutters in pulling a cut like this. A powerful drive is delivered through wide-faced, rugged back gears from a large proportioned single driving pulley. Great vertical depth in the knee with its wide bearing surfaces on both column and saddle insures non-sagging support.

The heaviest of milling that comes within the province of a column and knee type machine can be handled with ease on B. & S. Heavy Service Plain Milling Machines and at a rate that shows to advantage on production sheets. Send for literature covering these machines in detail—see for yourself what a big help they'd be in your shop—on your work.

For the Reason the Wood is Steamed and Bent with the Grain

RICH

Drills are Forged and Twisted Hot

The high-speed tool steel in Rich Forged Drills, Reamers and Bits remains as strong as the solid bar. Forged—instead of milled—the fine grain of the steel is not cut and weakened. Consequently, extra tough work at highest speed is ordinary work to Rich Forged Tools. They never burn or bind.

In lasting service you will find that Rich Forged Tools are as different from ordinary milled tools as solid oak furniture is different from glitter and glue. But the surface difference to the average man is not discernible. Therefore, when buying Drills, Reamers and Bits, know for certain that each is stamped: Rich Tool Company.

Machinery and Supplies

Everything in equipment for new plants, factories and mills is obtainable from us. Our special service department will give your enquiry careful thought and make suggestions without charge. Write us for your new equipment and supplies.

Thermographs.
Hand Levels.
Aviation Barometers.
Inclinometers.
Sphygmomanometers
Fever Thermometers.
Urinary Glassware.
Thermometers of all kinds for home and general use.

ANGLE AND STRAIGHT STEM THERMOMETERS

Every *Tycos* Thermometer is effectively protected from bursting during slight overheating by a safety chamber in the top of the glass tube. This feature renders them constantly accurate and reliable.

Our experience in successfully meeting thousands of temperature applications is your security. May we send you our catalogues?

Right Side Form Stem.

Taylor Instrument Companies
ROCHESTER, N.Y.

NOTE

Note that it is vertically adjustable—that it gives you all the advantages of a sliding drill head at a cost greatly less.

DEMCO DRILL

in the Bench Type illustrated is belt or motor driven at three speeds, the maximum being 12,000 R.P.M. Belt adjuster and automatic take-up keep belt at constant uniform tension. Construction is ball bearing throughout. Built in single spindle only for bench type; multiple spindles in floor type. Built in three capacities up to ¾" max.

Write for all details.

THE DeMOOY MACHINE CO.

Cleveland
Ohio, U.S.A.

The Quill Bracket

A Favorite---

Blount Pattern-makers' Lathe

FAST AND ACCURATE—Equipped with set over swivel tailstock and carriage, and outside face plate and tripod. Built in 16" swing with beds 6 or 8 feet in length. Spindle is made of high carbon steel, is hollow and fitted with Morse Taper and runs on self-oiling bronze bearings.

Our catalog gives a full description of this strong and highly efficient machine, also our other quality speed lathes and grinders. Give us your address.

MACLEAN'S

for DECEMBER

MACLEAN'S MAGAZINE GETS BETTER ALL THE TIME

Snipers and Sniping—*by a Sniper*

A SNIPER is back in Canada—a star sniper, who has 34 marks on his rifle, every mark meaning a German life. Most of us know absolutely nothing of the work of the sniper, but the story—a remarkable one—is told in the Christmas (December) MACLEAN'S by the champion sniper of the Canadian Expeditionary Forces. This man was buried by a shell-explosion, was dug out by two comrades, and has lived to tell his wonderful story, in MACLEAN'S. It's worth 15c to get this story alone.

"Politics From Within"

—Leacock, of Course

TRUST Leacock to see a chance for his witty and humorous pen. He deals with the humorous phases of electioneering in Canada in his usual vein.

Why Laurier sent Troops to South Africa

THIS contribution, by Col. John Bayne Maclean, goes backward many years—to the time of the South African War in 1899-1900. That was when Canada first took up arms for the Empire. Politics, of a high order, was back of the decision to send Canadian troops to the Antipodes. It is "inside" history.

Oppenheim—Allenson—McBeth—Mumford

A LONG instalment of Oppenheim's absorbing story, The Pawns Count, is given in the December MACLEAN'S. A short story, by A. C. Allenson is seasonable. Madge Macbeth contributes a complete novelette, The Man Who Wasn't. And Ethel Watts Mumford, teller of delightful tales, delicately told, gives us the first of a series of short stories—Love and the Locksmith.

The Usual Popular Departments

THE Business Outlook. The Nation's Business, Women and Their Work, and the Review of Reviews—all are present in strong way in the December MACLEAN'S.

At All News-Stands 15c.

Gadsby's Story of the Union Government

GADSBY is saturated with Ottawa knowledge—much of it of the inside variety. He pokes about, talks with big men; and big men, and lesser ones, talk with Gadsby. Useful sort of man, is Gadsby. What he hears and learns he writes about for MACLEAN'S; and in this story of his about the new Union Government, he reveals the undercurrents on the movement that developed into negotiations, and which finally resulted in a Union Government. Gadsby adds interesting biographical information to his brilliant study.

Robt. W. Service is back again

BACK in MACLEAN'S, that is—in body, he is still in Flanders—where the fighting grows uglier all the time. Service has taken time to write verse for MACLEAN'S. You know well the virility of his style, and the gripping, human character of his verse. It is about life and men in the trenches he writes—about our boys far from us. It is worth something to see our boys as Service sees them. Read "The Shape at the Wheel" in the December MACLEAN'S.

Arthur Stringer writes a Beautiful Christmas Poem

STRINGER is a wonderful man—wonderfully versatile, wonderfully human. He is a master of the short-story and of the detective and mystery type of story; and he can climb the heights of literary endeavor, as he has in this passing sweet poem—Christmas Bells in War-time. Your heart is tender these times of horrible slaughter and of heroic achievement, and you'll be grateful to Stringer for putting beautifully your innermost thoughts and feelings.

Annealing and Tempering Furnaces installed in the plant of the Canadian Vickers, Limited, Montreal.

"Mecol"

The installation of "Mecol" furnaces shown here is but one instance where a quality furnace was chosen to give maximum production. The furnace you may require is the one we desire to give you complete and full information about. Write us.

Mechanical Engineering Co.
Limited
THREE RIVERS QUE. CANADA

TYPE C-2

The Right Furnace For
Every Purpose

THE types shown are only two of over one hundred types and sizes of Gilbert & Barker Furnaces—a furnace for every purpose.

G. & B. Furnaces are built right. Their construction and design have been perfected by our half century of experience.

We offer you the benefit of this experience and thorough knowledge of modern heat-treating methods through our engineering department. The service is free. Put your problems up to us.

Just now we are making prompt delivery of these two types and many others. Send for Stock List 24.

Exact Temperature Measurement

In all heat-treatment operations, Thwing Pyrometers fill every requirement. Accurate to a high degree, they still have all the rugged durability to withstand the hard usage of the toolroom, the steel mill and similar places.

Thwing Instruments are built in both the Indicating and Recording Type, giving up to 12 readings on a single recorder.

Catalog No. 8 describes the entire line. Write for your copy.

Thwing Instrument Co.

34th St. & Lancaster Ave., Philadelphia, Pa.

Canadian Representative: Mr. James DeVon 227 Davenport Rd., Toronto, Ont.

WILLIAMS' "AGRIPPA" Tool Holders

"THE HOLDERS THAT HOLD"

The Planing Tool has a serrated ring of improved steel which affords unequaled variety and rapidity of adjustment. The ring is correctly hardened to resist the wear of the cutter. The body of the holder receives a very different heat treatment that prevents breakage.

For Heat Treating, Annealing, Carbonizing

Uniformity of temperature is maintained and accurately and easily controlled by a system of burners and dampers. Thus uniform results can be expected from every heat. The short time required for preparation and for the heating process speeds up the output and saves fuel. These are very profitable features to the manufacturer.

There are many other features of construction as well as workmanship that give these Tate-Jones Furnaces first place in the minds of men who KNOW.

Made in car type and two types of stationary hearth: (1) all fire brick, (2) fire brick with cast iron bars imbedded in the top.

TATE-JONES

OVERFIRED ACCURATE TEMPERATURE ANNEALING FURNACE

SEND FOR CIRCULAR—C-154

If there is one machine more than another where

Absolute Accuracy

is required, it is in the construction of an Experimental Lathe.

Accurate fitting, assembling, aligning of head and tailstock and carriage with lathe bed, is found without exception in the "Hendey."

Motor-driven. Besides regular equipment it has small tool cabinet for operators' fine tools—also gear closet for extra gears to cut special threads.

Let us tell you more about it.

SMALL TOOLS

Equip Your Tool Room With

PRATT & WHITNEY

Interchangeable Cutter Counterbores

and get the right combination at once.

HOLDER, CUTTER and GUIDE

With this combination you can immediately make the right combination for every counterboring job.

HOLDERS

End of holder is milled to receive the driving lug of the cutter, and there is also a hole and set screw to accommodate the shank of the guides.

GUIDES

Are of hardened tool steel. They are held in place by means of a set screw in the holder engaging a V-slot in the shank of the guide.

CUTTERS

Can be furnished of either carbon or high-speed steel.

The shank of the guide passes through the hole in the cutter and the shoulder between the guide and its shank keeps the cutter in place. Cutters can be sharpened on the face and the guide is simply pushed further in the hole after grinding.

Holders, Cutters and Guides are furnished in a wide range of sizes.

PROMPT SERVICE

is assured at our nearest store where P. & W. Small Tools are carried in stock. Place your order there to-day.

A true word well spoken

WE received a day or two ago a blotter-calendar—from one of our advertising friends. It is of fine quality, the printing good and the color pleasing. It is the message which the blotter conveys, however, which makes it unusual and interesting. Here it is:

American business men do not realize the value which trade journals and technical magazines might be to them in increasing their efficiency and in giving them a broad and comprehensive view of their business. Our foreign competitors read almost every article published upon their business with great care and thoroughness. Our trade journals and technical papers are the best in the world and they should be encouraged and supported by our business men.

"These papers are preaching the gospel of sound business on practical lines and are helpful, not only to business, but to the country as a whole. If the suggestions made by them in the past had been followed by our business men it would not be necessary at this time to point out some of the fundamental weaknesses in American business."

Adapted from the book, "Awakening of Business," by Edward N. Hurley, Chairman of the Federal Shipping Board.

The following excerpt from the letter which accompanied the blotter in question is equally interesting explaining as it does the reason why the advertiser spends his good money on expensive advertising to "boost" as he says the technical journal. The letter was written by the general sales manager and his name and the name of the concern he represents, though withheld here, will be supplied upon request.

Several people have asked me why I am "boosting the game" of the trade papers. They find it difficult to understand just how I expect to sell our product by getting people to read the technical journals; and many of them think me a fool for spending hundreds of dollars of my company's money to distribute these blotters. * * * *

My position in this matter is taken because of a very firm conviction that the people who read the trade papers are much better business men and hence easier to sell a **good** product to, than the men who do not read the trade papers. I have studied this question for several years and do not think that I ever found a man consistently reading the trade papers who was not a "live wire" and the sort of fellow I like to do business with.

On the other hand, I have found that the men who do not read the trade journals are unprogressive, addicted to haggling over trivial points and, on the whole, very hard to do business with. The people who read the business papers know what's what, and, in selling them, it is not necessary to spend hours of valuable time in the discussion of elementary points.

My attitude in this matter is possibly an unusual one but I am firmly convinced that it is the right attitude. Furthermore, I believe that if my ideas on this subject were brought to the attention of the people selling goods in the marine field many of them would see the matter in a new light and would actively co-operate with you in getting your publication into the hands of, even more, the men to whom they wish to sell.

The trade papers are doing a wonderful work; and every good business man should boost them all he can all the time.

If any advertisement interests you, tear it out now and place with letters to be answered.

SKF BALL BEARINGS

S K F equipped "Universal" Boring Machine

No. 2 of a Series of S K F Equipped Boring Machines

ENDURANCE

The bearings used in boring machines must be wearproof. That is why the best makers use S K F.

Made of the finest steel, to most exacting standards, S K F are not only accurate, they are lastingly accurate. The parts they carry are held with exactness; there is no shake, no looseness, no play.

If you are looking for enduring accuracy, consult our Engineering Service Department. Through their long experience they can recommend an S K F that will give you perfect satisfaction.

The Johnson Friction Clutch Is Being Used As A Part Of This Machine

Courtesy The Peerless Bread Machine Co., Sidney, Ohio.

Mixing Dough

is the vocation of this machine and the mixer is controlled by JOHNSON FRICTION CLUTCHES installed on the horizontal shaft and two Johnson clutches are used, one in each of the vertical columns. You know how Mother mixed her bread. You know how careful she was not to overknead it. The same is true with automatic mixers. The mixer must knead the bread to a certain consistency and then the Machine is stopped through the use of JOHNSON FRICTION CLUTCHES.

This installation is but another instance of Johnson Friction Clutch Satisfaction.

For Your Own Machines—

Have you thought of incorporating clutches? You know that people are known by the company they keep. So are all other things. Have you noticed the machines the JOHNSON FRICTION CLUTCHES are associated with? Let us introduce you to clutch satisfaction, THE JOHNSON FRICTION CLUTCH, so your machines may become acquainted. Write us about your requirements to-day.

Single Clutch Interior.

JENCKES CLASS DB-2 AIR COMPRESSOR

If you understand compressors look over the following outline. If you are not acquainted with these machines it would delight us to give you an introduction.

Inlet Valves are of the Corliss type, the outlet valves of the disc type; flood type lubrication, allowing a continuous flood of oil over bearings, crank pins, etc., while in motion. Machine of the enclosed type.

JENCKES CLASS CB-1 AIR COMPRESSOR

If your requirements do not justify either of the above machines, just bear in mind that we have a very comprehensive range that will cover all usual and unusual needs. The above is equipped with inlet and outlet disc valves; splash gravity lubrication system; extra large bearings; machine entirely enclosed.

WHY DO WE USE "IMPERIAL" MOTOR HOISTS?

Because they are—
- Very Compact
- Moderate in Weight
- Perfectly Controlled
- Simple and Durable

Because they have—
- Most Efficient Gearing
- Most Thorough Lubrication
- Reliable Automatic Stop
- Ball-bearing Hook Block

And they have still other good features.

Write for Bulletin 8006—It tells the whole story.

HAMILTON, ONT., CANADA

URANIUM

HIGH SPEED STEEL

Fewer Trips to the Grinder

The man who leaves his machine every few minutes to grind his tool is an expensive employee. Something is wrong. Nine times out of ten it is the high speed steel he is using.

By adding Uranium to high speed steel we have produced a cutting steel that is tough, that is strong, that will hold its cutting edge after ordinary tools have crumpled or burnt.

Cut down those expensive trips to the grinder by putting Uranium to work for you.

STANDARD ALLOYS COMPANY

FORBES AND MEYRAN AVES.

PITTSBURGH, PENNA.

High-Speed STEEL

The tools that are made with "Wolfram" High Speed Steel are warranted to be super-keen at the edge and super-strong at the neck.

WOLFRAM

Embodies a true and permanent alloy of Tungsten, Chrome, Vanadium and Iron. No better High Speed Steel in the world.

VULCAN CRUCIBLE STEEL COMPANY

ESTABLISHED 1900

Aliquippa - Pa., U.S.A.

Represented in Canada by Messrs. Norton, Callard & Company, Montreal.

Electrite

Electric furnaces, automatically regulated, the most modern methods, and the introduction of Uranium—make this a steel of truly remarkably cutting properties.

We know "Electrite" cannot be bettered — and stand ready to prove it to you.

Roelofson 6-in. Banding Machine

YOU couldn't imagine a more sturdy, compact, serviceable machine than this! A glance at the illustration will show you for yourself. It has been used in Canadian munition plants since the munition business started, and is still giving absolute satisfaction. It's the machine you need if you make shells.

Look over the following outstanding features of its construction:

Integral (en bloc) construction assures perfect rigidity, permanent accuracy and desirable compactness.

Chucking with spring collet chuck insures accurate and speedy chucking.

Graduated feed dial, two cutting tools, and ample belt power insure output of accurate work in least possible time.

Machines are built for 15, 18, 60-pdr. and 6" shells.

Roelofson Machine & Tool Co., Ltd.

Head Office: 1501 Royal Bank Building, Toronto, Canada
Works and Warehouse: Galt, Ont., Canada

Immediate Delivery

To shell plants changing over from the manufacture of the larger sizes to 6" shells, our ability to make **immediate delivery** should be of especial interest.

And remember that the Roelofson is one of the few banding machines that have stood up from the first of the munition game and are still doing duty.

If any advertisement interests you, tear it out now and place with letters to be answered.

GRINDING SEED WHEAT

WOULD YOU DO IT?

To grind seed wheat would be to deprive the future. It would rob men of fighting strength and those at home of bread.

To stint and save in the purchase of a machine that is to be depended upon to produce fighting and farming tools speedily and accurately is like grinding seed wheat—it deprives the future of materials that men will need badly.

A suggestion: before you buy lathes, carefully examine the merits of the high-quality "Sidney for Service" line which are sold in Canada by—

Cut shows Chuck on nosing operation. This is one of over two hundred in this Canadian plant.

This chuck is *built on the duplicate part system. It is simple, effective and fool-proof.*

It grips the shell in a predetermined position. The jaws will not slip on the shell. It has shell interior and exterior adjustable stops.

A trial on one of your lathes will convince you that this is THE chuck for shell work.

A Big Efficiency Unit in Your Shell Plant

A. J. LAVOIE'S

LOW PRESSURE

Compressed Air Chuck

This chuck can be applied to any make of lathe, without alteration to the machine, and will increase production from 25% to 75%. It grips and releases the shell while in motion—no need to stop your machine.

It is a single unit combination attached to the face plate of lathe, supported by an additional heavy duty bearing, thus making a heavy duty lathe out of a light machine. A small lever operates the chuck. Will operate with a pressure of 60 lbs. per sq. in.

MANUFACTURED BY

The Montreal General Tool Co.

673-5 Notre Dame Street, Maisonneuve, Montreal, P.Q.

Also manufacturers of shell tools, and special machine attachments of all kinds made to order.

Wells Self-Opening Die Advantages

QUALITY OF THREADS

The quality of threads cut by the W. S. O. D. is due to construction of the die head.

Chasers are held to the work by a solid steel shell which bears on all four lands directly back of the cutting teeth. (See diagram above). This shell also releases and closes the chasers, moving backward or forward in doing so.

The chasers fit in slots in a solid steel body. This prevents any tendency of the lands to tip, etc.

BIG PRODUCTION

The saving in time taken to back off, the free, easy cutting of the lands, the absence of trouble with the die head, all make for big, gratifying production.

LOWER COSTS

Saving in time, increased production, etc., mean lower costs, and consequently recommend this die for your use.

The W. S. O. D. is made in three models, one of which is particularly adapted to your special requirement. Tell us what your work is and we will recommend the right head for the job. Ask for literature and catalog.

DISTRIBUTORS FOR CANADA

"Over the Top"

Right down in the front trenches of metal working, in the no-man's land of production, the

Starrett Hack Saw

is doing its bit. The sharp, hardened tungsten steel teeth cut their way through rod or sheet, steel or copper as a machine gun cuts its way through opposing infantry.

While the excellence of Starrett blades has long been an accepted fact, never before have they been accorded the confidence they enjoy to-day. The rush and bustle attendant upon forced production have created a demand for a hack saw blade that will "stand up"—cut quicker and last longer.

Because we have made careful and thorough tests we are able to tell you just which numbered blade is best suited for each class of work. The result of these important tests, together with the unexcelled quality of Starrett Hack Saws, have placed our blades in the first rank of industrial preparation.

What blade to use is indicated on page 208 of our Catalog No. 213. Send for your copy.

That Wear-Longer Argument

It is claimed that the length of service of a file is immaterial, that it is the work done quickly which counts.

Our files agree with the cutting argument, but—they go a little further. They cut quickly first, last and all the time, and, like tried friends—

THEY WEAR

They have the teeth and they have the stock. Remember this brand and cut your filing costs.

Machining the British 6 in. Mark XI. High Explosive Shell

By M. H. Potter

Changes in the complexion of the shell industry have followed each other in recent months with kaleidoscopic rapidity, and the resources of manufacturers have on frequent occasions been severely tried in adjusting themselves to changes in type. The design of shell described herewith is that upon which many manufacturers are at present concentrating.

INASMUCH as many manufacturers have found this particular shell rather difficult to produce, and have experienced considerable trouble and delay in securing rapid and steady production, this article will no doubt be of timely interest. Special attention is called to the sequence of operations, the working gauges used and the tool equipment involved.

To those who seek the shortest methods and the least number of operations attention is especially called to the method as pursued in this instance. After actual tests by practical experience, the following was found to be the best in the long run. In other words, the easiest way is not always the best, nor is it the shortest. Air-operated mandrels and collet chucks were purchased.

Cut Off Open End

Operation 1, see Fig. 1.—Special machine or engine lathe with two cut-off tools set opposite; tools operated towards the centre by means of a cross-feed screw; the feed screw is operated by worm gears driven from lathe headstock gear.

Gauges.—Length gauge to extend from the end of bore, having a centre punch to mark shell before this operation.

Centre Closed End

Operation 2, see Fig. 2.—Engine lathe with special fixture; the shell and drill revolve in opposite directions; the fixture consists of a drill spindle mounted in a casting, having a V slide cross-wise to the shell centres, which allows the operator to place or remove the shell. The drill is ground at 60°, and has no side clearance.

Gauges.—A flat depth gauge is used.

FIG. 1.

FIG. 2.

FIG. 3.

FIG. 4.

Rough Turn

Operation 3, see Fig. 3.—The cutting tool is stellite welded to a machine steel shank.

Gauges.—A snap gauge for low and high diameters.

Bore

Operation 4, see Fig. 4.—Boring machine with single boring bar, having a taper hole and slot for driving key. The three boring heads are as follows: First, for roughing the straight part of bore; the two cutting tools are ¾ in. square and expanded to size by means of a taper plug screwed into the end of the boring head. Second, for roughing the taper and bottom of bore; two form cutting tools extending 1 in. on the straight part, held in taper slot in boring head by two machine screws; the holes (for the machine screws) are slightly elongated to permit the tool to be "packed up" to size. Old finishing tools are used in this head. Third, for finishing the bore; same boring head and tools (new) as used for the second cut.

Gauges.—Plug gauges for high and low diameter of bore; plunger gauge for depth of bore.

Rough Face Base

Operation 5, see Fig. 5.—Special open-end machine or engine lathe.

Gauges.—Length gauge to extend from bottom of bore to end (outside) of base, having a centre punch.

Re-centre

Operation 6, see Fig. 2.—Same as operation 2.

PRINCIPAL DIMENSIONS OF BRITISH 6-IN. H.E. SHELL.

Re-rough Turn

Operation 7, see Fig. 6.—Re-rough body and finish turn base; engine lathe with single-pointed cutting tool.

Gauges.—Snap gauge for high and low diameters of body; similar gauge for high and low base diameters; form gauge for length of base diameter.

FIG. 5.

FIG. 6.

Chamfer Open End

Operation 8, see Fig. 7.—Engine lathe with special tool holder; the tools being set so that the cross-feed is not required.

Gauges.—Flat gauge for form of chamfer.

Re-rough Face Base

Operation 9, see Fig. 8.—Same as operation 5, a similar gauge being used (distance between end of gauge and centre punch being 1.50).

Nose-in

Operation 10, see Fig. 9.—Hydraulic press and oil furnace; the shell is placed (about 6 in. of the open end in the furnace) and heated to a white heat for a distance of 1½ in. down the open end.

Gauges.—Outside length gauge for over-all length of shell; ball gauge for diameter of hole in nose.

Bore and Ream Fuse Hole

Operation 11, see Fig. 10.—Turret lathe, 1st turret; drill 1 11-16 in. diameter; 2nd turret, facing cutter, having an adjustable rod to extend to base (inside); 3rd, two single-pointed boring tools for double diameter of nose, having two threaded collars to regulate depth of bore; 4th turret, double diameter reamer, with adjusting collars, as used on 3rd turret; 5th turret, rose reamer for angle of fuse seat, with pilot pushing in bore of nose.

FIG. 11.

B is the machine steel holder with a round shank to fit in the tool block D. The taper pin clamp E and key F permit of quick handling, as the tool must first be placed in the nose of shell and then clamped in position in the tool block. The shank at B is made as large as possible. The blade C is kept in line with the guide roller A, which keeps the bored contour in line with the bore proper.

Gauges.—Plunger gauge for distance of fuse seat to bottom of bore; plug gauge for high and low diameters of gaine seat; similar gauge for high and low diameters of fuse hole proper; length gauge for length of bore in fuse hole.

FIG. 7.

FIG. 8.

Finish Contour Inside Nose

Operation 12.—Engine lathe, with boring fixture (see Fig. 11), with explanatory note.

Gauge.—Length gauge for length of fuse hole.

Finish Turn Body and Nose

Operation 13, see Fig. 12.—Engine lathe with cam profiling attachment; expanding centre in nose end of shell, see Fig. 13.

FIG. 12.

FIG. 13.

FIG. 14.

Gauges.—Snap gauge for high and low diameter of body; ring gauge for high body; ring gauge for low body; two latter used by inspector for checking; form gauge for nose profile.

Recess and Thread Nose

Operation 14, see Fig. 14.—Engine lathe, with special tool post and tools (see Fig. 15 and explanatory note).

Gauges.—Combination (thread) gauge for threads and checking angle of fuse hole; length gauge for distance of recess from fuse hole seat.

Weight

Operation 15.—Special Fairbanks basket scale or regular platform scale (platform set flush with bench top); see Fig. 16 and explanatory note.

TABLE OF WEIGHT TO BE REMOVED

	LBS.	OZS.		LBS.	OZS.	BLOCK	INCHES
HIGH LIMIT	84	15	to	85	2	1	0
	85	3	-	85	6	2	1/32
	85	7	-	85	10	3	1/16
	85	11		85	14	4	3/32
	85	15		86	2	5	1/8
	86	3		86	6	6	5/32
W LIMIT	86	7		86	10	7	3/16

FIG. 16.

Explanation of table: Should the shell weigh 85 lbs. 12 oz. it is stamped 4, which means that block 4 is used in the following operation (16).

FIG. 17A.

The shaft A is lengthwise of the lathe, and is driven by the headstock gears; at the rear is the worm B. The lever C carries a cam which meshes the worm with the worm wheel. The hand wheel D (when A is not in mesh) allows the operator to bring the cam E into the desired position. The chain F drives the main cam shaft G. The roller on H swings from J and carries the block C. These blocks (Nos. 1, 2, 3, 4, 5, 6, 7) vary in thickness at D in 32nds of an inch (see table, Fig. 16). The cam E has a lift which gives a feed of 100th of an inch to one revolution of the shell. The tools K and L are against each other, the distance M being 1/32 larger than the finished shell, which permits the tool K (recessing) to be brought to the left 1/32 of an inch to take a finishing cut off the side of the recess.

FIG. 19.

The turret carries three independent tools—A the circular grooving tool; B the flat waving tool, which is operated by a face cam running against the roller C. The coil spring E keeps the tool holder against the cam. The undercutting tools F are mounted in the holders G, which have racks cut in their shanks. The gear H meshes with G, and by means of the handle J (through the worm and worm wheels K) the tools are fed forward.

FIG. 20.

The ring A is a slide fit over the base end of the shell, the distance B being equal to one-half the width of the planing chisel.

FIG. 21.

The nose of the shell is screwed on the threads A. The threaded lock nut is then driven against the nose (the taper C being 18° to match the taper of the fuse hole angle). The taper shank D fits the lathe spindle.

FIG. 22.

The outer ring A is grooved at G; the spacers (2 set opposite) C lock this (A) outer ring to the inner ring B. The stamps D (projection E) prevents the stamps from falling out when the fixture is not in place on the shell. Blank pieces a little shorter in length than the stamps are used to fill in with.

FIG. 23.

A is the sizing reamer for the gaine seat diameter. The threaded nut C is screwed into the fuse hole and the reamer operated by means of the handle D. B is the seating (rose) reamer. The reamer proper is keyed to the threaded stem G. The nut H forces the thrust bearing J against the reamer. It is operated by the handle K.

FIG. 24.

The belt-driven pulley A drives the shaft B. The shells are represented by C. The idle rollers D are bracketed to the bench; E are roller stops, which hold the shell in place.

FIG. 25.

The shell A is revolved in rollers, as in Fig. 24. The varnish spray gun is mounted on a base B, which is flanged to slide along, the board C, which is also flanged to suit the base of the spray gun.

gauge for high and low diameters of ribs; snap gauge for high and low diameter of groove.

chine; see Fig. 24 for roller fixture for revolving shell to facilitate cleaning.

Varnish and Bake

Operation 26.—Special shell varnishing machine or fixture; see Fig. 25. Gas ovens to accommodate roller trucks, with structural steel racks to hold shell's nose downward; the required heat and length of time required depends upon the varnish used.

Turn Band

Operation 27, see Fig. 26.—Open end machine or engine lathe; for fixture see Fig. 27.

FIG. 27.
The two tools A for trimming to width are fed in independently by the handles B; D is the rough forming tool, and E the finish forming tool.

Gauges. — Snap gauge low and high diameter of band; ring gauge high diameter of band; ring gauge low diameter of band; flat gauge for form of band; high and low width of band and high and low distance from base.

Final Inspection

The following gauges are used: Ring gauge for high base; flat form gauge for profile of nose; cylinder gauge for concentricity.

Final Government Inspection

After which the shells are placed in the bond room previous to boxing and shipping.

NOSE AND BAND GROOVE DETAILS OF 6-IN. SHELL.

SUBMARINES TO RAISE SUNKEN SHIPS

THAT the submarine considered as an engineering creation may be put to practical constructive use in salvaging sunken ships seems likely from the details which have been received regarding an invention by W. D. Sisson, an American engineer. Full particulars of the contrivance are not at present available, but from such as are given the general working scheme may be deduced.

The four accompanying engravings are from photographs taken in the shop where the diving bell was built, and it is uncertain whether it has yet received its initial test in actual working conditions.

The hull is a vanadium steel sphere, 8 ft. in diameter, and consists of two halves with a water-tight joint, by means of which they are bolted together. It is built sufficiently strong to withstand the high pressure which will be encountered when submerged to great depths and is roomy enough for the two operators and the working apparatus.

The object of the invention is to provide a device which will drill hobs in the sides of the sunken ships, thus affording a means of attaching a series of sunken pontoons to the vessel to be lifted, so that when the requisite number of pontoons is in position the water in them may be pumped out, and the resulting buoyansy will lift the ship. The drills used are 2 in. in dia. and driven by electric motors inside the shell. The sphere is held tightly against the sides of the vessel on which it is operating by means of a series of electro-magnets attached to the outside of the sphere by spindles passing through holes in the four adjustable saddles, which may be seen in the two engravings. Four 3,000 candle-power incandescent electric lamps enclosed within a 2 in. glass protector, reinforced with steel net, are attached near the magnets, outside the shell, for throwing light on the work and the operators are enabled to see what they are doing by looking through lenses 4 in. thick in the sphere.

It may be explained that the steel pontoons which will be used are 40 ft. long and 15 ft. dia. and each has a lifting power of 300 tons when exhausted. It is proposed to have the submarine guide the pontoons to their places after drilling the holes, and for the purpose there are four propellers and a rudder so arranged as to propel the globe in a horizontal or vertical direction, as desired, at a speed of two miles per hour. Just how the actual attachment of the pontoons to the ship will be accomplished we are unable to state.

The submarine and equipment weigh 6 tons in the air and are lowered into the water by means of a cable strong enough to support a weight of 56 tons. Through this cable also run the wires for carrying current to the electric machinery and lights as well as the telephone wires. The atmosphere within the sphere is replenished by oxygen from a cylinder capable of supplying sufficient oxygen over a working period of 72 hours. Chemicals are doubtless provided to absorb the carbonic acid gas produced by respiration.

OVERALLS NOT NECESSARY FOR WOMEN WORKERS

CHESTER B. LORD, general superintendent of the Wagner Electric Manufacturing Company, of St. Louis, declared at the recent convention of the American Society of Mechanical Engineers that the women workers in munitions and other plants who consent to wear overalls are of the masculine type and are usually lacking in sex-consciousness. He believed, however, that all women workers in a plant should be made to dress alike and his plant had found out

ARRANGEMENT OF DRILL MAGNETS AND SHIFTING DEVICES.

EXTERIOR MECHANISM OPPOSITE PROPELLERS.

by experience that the best clothes for women workers were a dark skirt, an unfadeable blue linen waist of standard design and a uniform apron. He said that all women workers would usually obey such rules about their clothes provided the rule were enforced for everyone. The uniform clothes were optional on Saturdays as many women desired to shop on the half holiday. Woman workers had usually an inherent fear of men and were willing to follow to the letter rules laid down for them.

Mr. Lord said that in employing women successfully in plants many little things had to be taken care of that would contribute to their contentment of mind without which they were not efficient. He said that all the machines in the shops of his company employing women were painted white and special attention had to be given to cheerfulness and cleanliness throughout the workrooms and conveniences. He also said that in his plant there were on an average of two marriages per month among the employees and they were always very successful chiefly because under the conditions of working, women depended entirely upon their natural advantages to attract the men, and the clothes consciousness and vanity of the woman were eliminated.

LOOKING INTO THE LOWER HALF, SHOWING LAYOUT OF MACHINERY.

LABOR SAVING APPLIANCES IN FERRO-CONCRETE WORK

By O. C.

IT has always been the policy of modern engineers to encourage the design of machines for the efficient, rapid and economical performance of work formerly carried out entirely by manual labor. The extended employment of machinery is more than ever necessary to-day in view of the existing labor shortage. Owing to the circumstance that ferro-concrete work is executed on the site without previous preparation of the materials, the suggestion may perhaps be made that this class of work offers little scope for labor saving appliances. That may be so in comparison with steel construction, for which a large amount of preliminary work has to be carried out in the machine shops, the fitting shops, and the erecting yard, but mechanical aids are of much value to the reinforced concrete builder.

Amongst them may be mentioned appliances for handling materials delivered on the site, machinery for crushing, screening and otherwise preparing aggregates in mixing concrete, for hoisting and distributing this mixed material expeditiously to the places where it is to be used, for cutting, bending, and otherwise preparing bars and strips, employed as reinforcement, and for various woodworking operations incidental to the construction of moulds, not to mention anything of the elaborate plant required in connection with the execution of large contracts. It is sometimes possible to execute all the necessary work by means of very simple mechanical appliances but as a general rule it will be found advantageous to make a special study of the aids available for the substitution of machinery in the place of hand labor.

EXTERIOR VIEW. NOTE PROPELLERS AND RUDDER.

AN important activity of the American Society of Mechanical Engineers is its work in co-operation with government bureau chiefs and manufacturers in securing and maintaining uniform standards in gauges used in the production of guns, ammunition, motor trucks, aircraft and other war material, and a public meeting of its gauge committee, held recently, was largely attended by manufacturers and their representatives.

PRODUCTION METHODS AND DEVICES

A Department for the Interchange and Distribution of Shop and Office Data and Ideas Evolved from Actual Practical Application and Experience

MACHINING BLOCKS FROM POT CASTING

By Frank H. Mayoh.

AN example of machining thin square-shaped blocks in a rather interesting manner is shown by the accompanying illustrations. These blocks have a round hole bored in them, and the dimensions of the same are shown in the lower view of Fig. 1. In the upper view of Fig. 1 a pot casting from which these blocks are made is shown, and it will be noticed in this connection that a round beveled flange is cast at one end. This flange is for gripping purposes while performing the various operations.

FIG. 1. POT CASTING TO BE MACHINED AND FINISHED BLOCK.

In making these square blocks, the operations are performed in the following manner, the first of which is turning the beveled flange. This is accomplished by gripping the pot casting in a four-jawed chuck in the usual manner on a lathe, when by using a broad nose tool the beveled surface X is turned true, this being a necessary preliminary operation, as by so doing we have a satisfactory gripping surface from which the pot casting may be held true while performing the remaining operations. The second operation is performed on a chucking machine, as illustrated by Fig. 2, the method of doing this being obvious, as it merely consists of boring the hole with the cutter A held in a boring

FIG. 2. METHOD OF BORING THE POT CASTING.

bar, the pot casting being gripped by the flange in a three-jawed chuck.

The boring bar at this operation is piloted in a bushing B held in the chuck. Having bored the hole, it is now necessary to machine the four sides of the pot casting and saw it apart. Machining of the sides in this case is performed on a shaper using index centres, and the man-

FIG. 3. METHOD OF SHAPING THE POT CASTING SQUARE.

ner of performing this is shown by Fig. 3.

For this operation the pot casting is again held in a three-jawed chuck A by the flange, while the other end is supported by means of a plug B in the bored hole; the plug is held in an angle plate C, which in turn is bolted to the platen of the shaper. One side of the pot casting is now machined by feeding the tool across the work in the usual manner, and after one side has been machined the pot casting is indexed quarter-way round and machined in the same manner,

FIG. 4. METHOD OF MILLING OUT BLOCKS.

likewise the two remaining sides are machined, thus completing the rectangular shape of the pot casting. In this connection it is well to notice the recess Y in the pot casting which was provided as tool clearance for shaping into.

The pot castings being now finished, we come to a very interesting operation: that of cutting the pot casting into blocks. Anyone who is familiar with turning square bars in a lathe knows how hard this operation is on the tool and machine when starting to cut, as the tool is only cutting during four intermittent periods of each revolution and, therefore, there is a tendency for the tool to dig in or pound as it takes the cut.

Nevertheless, while the turning of square or irregular-shaped work may be readily accomplished in the lathe by using a rugged tool, this operation becomes increasingly difficult when using a narrow cutting-off tool; therefore, it was decided to perform the cutting-off operation of the blocks on a vertical milling machine, as shown in Fig. 4. For doing this the gang of cutters A was provided; the casting itself was again gripped in a chuck B, which in turn was held on a circular milling attachment C. To cut off the blocks the cross-slide was brought out enough to allow the work to be clear of the cutters while it is being placed in the chuck, following this the cross-slide was fed in until the cutters were through the hole of the pot casting. In this position the cross-slide of the milling machine was clamped, when by causing the rotary attachment to revolve the blocks were sawed apart. A view of the pot casting showing the saw cuts through it is indicated as D, and it will be noticed that the upper cutter on the arbor is a surface mill for facing the end of the casting.

Another point in connection with this gang of cutters is that each cutter is slightly larger than the one below, so that the upper block will be cut off first and each one below in turn will be cut off next.

TONS OF COAL IN ELONGATED PILES

By N. G. Near.

WHEN bituminous coal is piled in a conical pile the tonnage in the volume is easily estimated from the formula, $0.00248\ D^3$, where D is the diameter of the pile in feet at its base. But coal is often stored in elongated piles, as shown in the accompanying sketch, in which case the tonnage of bituminous coal is computed from the formula:

$$0.00248\ D^3 + 0.00474\ AD^2 = \text{tons (bituminous)}$$

where A is the length of the "crest" on the pile in feet. The best way to deter-

SKETCH SHOWING METHOD OF CALCULATING COAL PILE CONTENTS.

mine the length of this crest is to subtract D from the total length of the pile at its base.

The sketch shows one of these piles both in elevation and in plan. The plan

shows clearly how the pile can be cut up into three parts. The two curved end portions, when added together, give us a pure and simple cone, whence we have the 0.00248 D^3 in the formula. The central portion has a triangular section from end to end, and its volume is one-half as great as would be the volume of a rectangular block having the same base and height. The tonnage in this central triangular portion is 0.00474 AD^2. Adding the two together we, therefore, have $0.00248\ D^3 + 0.00474\ AD^2$.

Where the coal is anthracite instead of bituminous the formula becomes

$$0.00172\ D^3 + 0.0033\ AD^2 = \text{tons anthracite.}$$

D and A are both measured in feet.

These formulas are based on the fact that one ton of coal occupies 38 cu. ft. on the average, whether anthracite or bituminous. The natural cone of anthracite is 0.25 as high as it is in diameter at its base. For bituminous coal the value is 0.36.

LOADING TIME FUSES

By G. C. White.

ALTHOUGH there have been many thousands of time fuse component parts made in this country, there are very few who know the essentials of the loading operation and while not strictly of a mechanical nature the process is interesting. Like the manufacture of components, the loading requires great exactitude and attention to detail. It is not the intention of this article to deal with all the operations necessary in loading, but to give a general idea.

Holes to Be Drilled

The real loading is performed on the top and bottom rings by pressing a certain mixture of powder or composition, as it is called, into the routing channel. This composition must have a vent in order that it may burn, for if there were no vent and the burning were confined, an explosion would occur and the slow burning or time effect would

FIG. 1.

be lost. The vents are what the manufacturer of components calls the escape holes and they are elliptical in shape on the British fuse. The escape holes are connected with the composition channels by holes drilled through the escape hole. The extreme end, next to the flash hole where the flame from the detonator in time pellet comes through into the ring, is drilled with a hole in the powder vent called the vent hole, which enables the powder to commence burning, until such time as the powder pellets, which have been inserted into the hole connecting up the end of composition channel and escape hole and the escape hole itself, can be ignited.

Jigs for Drilling Holes

All work done in drilling these holes and in routing is located by a work hole. The jigs used are shown in Figures 2, 3 and 4, and their operation needs no explanation. The jig for drilling the flash hole in bottom ring is somewhat different from that used for the top ring as it must be drilled and counterbored. The jig proper is made with a wing and after the counterbore is drilled the

FIG. 2.

wing is thrown out of the way and the jig moved along the guides until it strikes the stop, when the other hole is drilled. A double spindle Avey drill is used. All these operations are done after the fuse composition has been pressed in.

Blending and Loading the Powder

The blending of the powder is a very important part of the loading and in this department nothing is left to chance. The powder used for loading is of two kinds, grain and mealed, but for the purpose of this description it is unnecessary to go into the details of their respective merits. It is sufficient to say that there is very little difference in their efficiency. The powder is divided into two grades, low powder 21.5 to 21.8 seconds and high powder 22.2 to 22.5 seconds. The ideal blend is of course half and half, but it is sometimes necessary to mix two to one. A trial mixture is made up and sample fuses are tested at rest in an electrical machine which automatically records the length of time consumed. A sample is also tried by spinning a fuse at 2,500 revolutions per

FIG. 3.

minute in a specially designed lathe and the time also recorded. If these tests are satisfactory, a sufficient quantity to load a lot of fuses is made up and a retest is made. If this is satisfactory the required amount is weighed out and sent in air-tight cases to the loading rooms.

These loading rooms and the powder blending department are conditioned, or in other words kept at a temperature of 70 degrees, and at a constant atmospheric condition, as it is an established fact that barometric conditions affect the time of burning and so exacting are the specifications in regard to the time, that compensations must be made for variations in atmospheric conditions. As a safety first precaution, the loading de-

FIG. 4.

partments are divided into small compartments, each capable of turning out about 4,000 rings per day with 13 men. The loading operation consists of weighing out the powder, evenly distributing

it over the ring, assembling the loading tool, compressing the powder and disassembling the tool.

The Loading Tool

The loading tool consists of a mould

FIG. 5.

which affords support to the bottom and outer diameter of the ring. A circular plug is inserted into the bore with a press fit, the idea being to prevent the ring from distorting under the loading pressure which is applied under a slightly modified Riele or Olsen testing machine. The pressure required is approximately 40,000 and 46,000 pounds for the top and bottom rings respectively, which works out approximately 29 tons per square inch. This pressure does distort the ring and after the centre support has been pressed out the bore will close in, making it necessary to ream the ring, which is the first assembly department operation. These operations may be divided up as per the operation table, from which it will be seen that the top ring, bottom ring and body operations are kept separate.

The rings are now faced off on shaving machines which run about 600 r.p.m., which is not fast enough to ignite the powder. Surplus brass and composition cut off in the shaving operation is drawn by air through a galvanized iron container to a tank containing water which kills the powder. The rings are piled on trays for convenience in handling and sent to the assembly sections where the holes are drilled as described.

Operations on Top Ring

Rebore.
Drill powder vent.
Drill flash hole.
Lacquer.
Insert escape hole pellet, seal and shellac and put on paper washer, dry and trim edges.
Put on wax.
Put powder pellet in flash hole.

Operations on Bottom Ring

The work on the bottom ring is similar to the above with the addition of the following operations:

Put on felt washer with 100 pounds pressure.
Inspect to see that hole in felt washer coincides with flash hole.
Body operation.
Put on shellac.
Insert powder pellet in flash hole.
Put on felt washer under pressure.
Inspect to see that hole in felt washer coincides with hole in body.
Put rings in place.
Drill securing pin holes.
Take off rings and remove cuttings and burrs with a file.
Reassemble and insert securing pins.
Inspect and insert time arrangement.
Put on cap.
Tighten cap.
Drill for set screw and insert.
Tighten set screws.
Try tension on bottom ring after being sure felt washers have had time to dry.

Insert percussion arrangement after having inspected it and inspect to see that all parts of the arrangement are correct in place.

Tighten base plug.
Put in base charge of powder.
Put in filling hole plug.
Shellac base.
Solder on weather cover.

The assembly departments are for convenience divided up into sections, each capable of turning out 6,000 fuses per day of 10 hours. The components are handled separately on long tables until is becomes necessary to assemble, when they are grouped together.

FIG. 6.

CLAMPING BLOCK FOR EMERY CLOTH

By R. Hamilton

WHEN it is required to fasten emery cloth or sand paper to a block of wood the general practice is to fasten the cloth on the wooden strip by means of small tacks; the sketch here shown illustrates a very handy and serviceable device for this purpose and one that can be easily made from a small piece of

CLAMPING BLOCK FOR EMERY CLOTH.

wire and sheet steel stock. The wooden block can be made of any desirable size and by cutting a groove in each end as shown at B will provide an efficient means for clamping the cloth by means of the toggle arrangement of the U-shaped wire and clamping lever D. The dotted line shows the clamp open to allow of inserting the cloth which is placed over the top A and between the end of the block and the wire C. When the cloth is in position the piece D is pressed back against the block so that the center line of the wire C is forced over the center of D, thus locking the toggle and also the cloth in position.

TO deaden the noise from trucks rumbling over a concrete floor, a factory has successfully used a heavy tar paper pasted to the floor by paint. The method of application is as follows: The floor to be protected is first given one coating of grey cement paint. On the following day when the paint is thoroughly dry, a second coat is applied. At the same time one side of a five ply tar paper is painted and when both paper and floor are still wet the paper is carefully laid, wet side down, on the floor and rolled with either a roller or wide tired truck until all signs of air pockets beneath the paper disappear. The surface seems to improve with age and very effectively reduces noise at a low cost to the lowest possible minimum.

Modern Welding and Cutting Processes in Locomotive Works*

By A. F. Dyer **

The practical applications of processes which but a few short years ago were looked on in the light of scientific novelties is only confirmatory evidence of the soundness of reasoning and courage of conviction which prompted the different pioneers in each line. The manner in which the two processes have proved to be complementary to each other is additional evidence that there is a field for every advancement in applied science.

At the present price of material, scarcity of labor and difficulty of obtaining steel and iron, welding and cutting by both the above processes has proved a great boon and an almost indispensable factor in railroad repair shops.

Seven years ago we employed one man as an acetylene welder and owing to failures through his lack of experience the process was nearly condemned, but as we gathered experience both gas and electric welding developed, so that now instead of one man we employ eighteen and have often to work them overtime.

Acetylene Systems

The low pressure acetylene gas system is used and the whole shops are piped for the acetylene; every other repair pit has a drop connection; in roundhouses we use dissolved acetylene in cylinders, which saves the expenses of a generator and piping where the process is only in use occasionally.

There is a great difference in opinion as to the relative merits of high or positive pressure and low pressure gas, the manufacturers of pressure outfits contending that you save oxygen by using their type of generators and claim that you can not get so near to a netural flame with the low pressure gas as you can with the high; the makers of the low pressure outfits claim that by the use of an injector embodied in the torch or welding head a neutral flame can easily be obtained; we find we can obtain a flame as nearly neutral as can be obtained with the outfit we use, although with pressure gas you can obtain a much larger flame for the same size head than with the low pressure. The principal factor, however, that made us decide on the low pressure outfit was the fact that our main supply pipes are carried overhead throughout the shops, and as nearly all, if not all, oil, steam and water pipes are overhead, we had to consider a very well known motto, viz., "Safety First," for if a man was working overhead and by mistake broke a joint of the gas pipe his torch or candle might cause an explosion, which might wreck the shop. I may say that, though we have been using the acetylene gas for eight years, we have never had an explosion of any sort yet. Our low pressure generator went through a big fire two years ago, and we were enabled to repair it and use it for several weeks till we received our new outfit.

Electric Outfits

There are many kinds of electric welding outfits on the market, and, of course, each one is claimed to be the best by its respective makers; each has its advantages, and the old prejudice very often exists among operators that the machine they are using and are familiar with is the best, and they will stick to that opinion until they become accustomed to the new machine. A new equipment using alternating currents instead of the direct current is now being put on the market, and only weighs 150 lbs., and gives from 20 to 200 amperes, and is about 50 per cent. cheaper than any D.C. machine on the market.

The electric welding outfit consists of two generators, each operating four welding circuits; the shops are wired, and at convenient places connection boxes are placed and only need a lead and ground wire connected to them and the work on which the welder is engaged.

The outfit used has panel controls, which allows each man to control his amperes independent of the other welders.

The processes have proved themselves fitly to be ranked amongst the greatest time and labor savers, and also we may safely say money-savers, introduced for a long period. For instance, in the not very distant past, a locomotive with a broken frame was due for a period of several days in the shops before they could strip down one side and remove the frame to the smith's shop, weld it, and perhaps have it machined and then replaced; now we drop the pair of wheels which may cover the break, cut out the crack with the cutting torch to the shape of a double V at an angle of 90°, clean off the oxide caused by cutting and weld up with the metal electrode, using soft steel or Swedish iron, a frame 4 in. x 5 in. being cut and welded in under 14 hours, and it can be done in less time by having two operators on the frame at once, but the men do not like facing each other's arcs, as when they are changing their filling rods their eyes get sore.

Frames, when worn by brake gear and stays, are built up and worn holes are plugged and welded instead of reaming them out to a larger size and thereby weakening the frame. In rebuilding and superheating engines the same boilers are seldom used on their original frames, and in very few cases do the various holes in angle irons, furnace bearers, etc., come into alignment with frames or boilers; these holes are welded up and redrilled.

The present price of tool steel demands that none shall be wasted; therefore, we use it down to the last inch by welding it to tire steel. Twist drills, taps and reamers when broken near the socket end are welded and put into use again; for this purpose we use either the electrode or gas, but in both cases we use vanadium steel filling rods, as we find this gives the best results. Spokes of driving wheels are welded and flat spots on tires have been successfully welded up when it was necessary to do so.

Up to now we have not had much success on cast iron with the iron electrode, although with the carbon you can make a fair job, but the gas is unquestionably the best for any of this material. We have successfully welded with the gas, steam shovel engine frames, slides and cylinders by welding in patches of cast iron where worn or broken. When our contract for shells was completed and the lathes that were used for this purpose were being overhauled, it was found that most of the V slide beds were worn down by the tool carriers; these were built up with the gas, which saved machining these beds down in many cases ⅜ in.

Boiler Work

In regard to boiler work, most of the welding is done with the iron electrode, using a mild steel or Swedish iron as a filler; it is found that the electric process localizes the heat more so than the gas, though it is the writer's humble opinion that the gas makes a closer and neater weld, as all welds made by the electrode are more or less porous unless hammered up. It pays better whenever possible to do so to put quarter or half sides in order to get out of the fire line in preference to putting in a patch, for, as a rule, however well the patch is welded it generally gives out in from twelve to eighteen months' service, and the same applies to cracks, whereas the half or quarter side should last as long as the firebox.

When a nest of small cracks is found round the staybolts the bolts are removed and the holes countersunk and welded up. This method has been found to be very successful. Corner patches are welded in by running the patch into the tube or back sheets, as the case may be, at the same time removing the flanges. If it is decided to do away with a number of tubes, plugs are welded in the holes, first countersinking the holes and having the plugs punched by a countersunk die which gives the proper bevel for welding.

A great deal of trouble was experienced when welding in the superheater flues and tubes when this was first started, but after a little experience much better success was arrived at. Some operators prefer the tubes belled and others

*Read before the Canadian Railway Club, Montreal, Dec. 11, 1917.

**General Foreman, Welding Dept., Grand Trunk Railway, Montreal.

prefer them beaded; some prefer the water in the boiler and others do not.

The operators I am connected with like the belled methods best and with the water in the boiler. This keeps the tube sheet from heating, especially round the smaller tubes. Tubes are set in with copper ferrules set back 1/32 in. and the flues are belled out 3/16 in. to 7/32 in. and the small tubes 3/16 in. The sheet is roughened all round the tubes and flues, and the oil is then burnt off with the oxy-acetylene flame and tubes and flues welded in with electrode, using ⅛ in. mild steel or Swedish iron; the latter is preferred if caulking is needed.

Output Performance

A sample of an average day's work is as follows for a gang of 12 men:

14 rivet holes in smokebox and 4 peg holes in foundation ring.

10 tube holes in upper portion of firebox tube sheet.

2 air pipes which were worn through.

In the tool room:

1 ratchet for jack (2 teeth replaced).

1 gear spindle built up.

1 chuck screw key end built up.

1 boring shaft built up from 2½ in. to 2⅞ in.

2 tool holders rebuilt.

1 air hammer handle repaired.

6 teeth in lathe gear built in.

1 cone, small end filled up solid.

2 1¼-in. holes in top rail of frame filled up.

4 cracks 18 in. long in right side sheet welded.

14 bottom tube holes welded up.

2 washout plug holes built up for retapping in round head.

Cut out frame for welding and started welding same.

Welded bushes in pony truck stays.

Cut out 3 sets of boiler tubes.

Cut out 1 set of superheater flues.

Build up caulking edge of fire hole.

Heated corners of tube sheet for closing.

Welded broken superheater damper bracket.

Built up reversing lever where worn.

Built up 2 side rods where worn.

Cut out 48 flexible staybolts in firebox.

Welded 2 cracks in throat sheet.

Air Brake Department:

1 broken flange of air brake cylinder.

In addition to this list two men are engaged continuously on cutting around the shops.

For cutting steel and wrought iron the oxy-acetylene process has practically no competitor, it being impossible with the carbon point to cut as fast or as fine and neatly as the gas torch, although for scrapping fireboxes and frames, the carbon point is cheaper if time is no object and labor cheap.

The foregoing examples only enumerate a very small fraction of the uses to which the two methods of welding and cutting are being put to in locomotive repairing and machine shops, and fresh uses are being found for it every day.

Both Processes Valuable

No roundhouse should be without an oxy-acetylene outfit, both for repair work and as a part of the wrecking outfit; many days are lost by engines being tied up through parts having to be sent to the nearest big shops for repair, which could be repaired on the spot with a welding and cutting outfit. All large roundhouses should have both processes, as they would pay for themselves over and over again.

In concluding, I would state that though there are many different opinions as to which is the best process, no shop is complete unless it has both equipments, although the gas has really the widest range, but, on the other hand, a heavy piece of steel or iron needs no preheating with the electrode, but welding can be commenced as soon as your arc is drawn; 95 per cent. of the failures which occur, instead of being laid on the process, should be placed on the shoulders of the operators.

Welding should not be treated as a side line of the machinists' or boilermakers' business, but should be treated as a trade in itself, as it really is, for it needs the entire concentration of a man's mind, careful study, plenty of practice and a conscientious man to make a welder.

Wherever possible a separate building or suitable space should be provided for bench work, and should be equipped with a suitable furnace for heating and annealing castings, and also have plenty of floor room to allow of charcoal fires being built for preheating cast iron jobs for welding.

A TREATISE ON SHELL VARNISHING

By Chief Examiner

THE question of varnishing a high explosive shell is one the importance of which cannot possibly be too strongly impressed upon the minds of all concerned in its manufacture. Many lives have been wantonly sacrificed, and countless dollars worth of damage has been done, through carelessly and improperly varnished shells.

Why is a shell varnished at all? To give it a nice, pretty appearance? No. It is varnished:—First, to make absolutely certain that the bore is smooth—perfectly smooth; second, to protect the bore from rust; third, to prevent the high explosive from coming in contact with the steel and thereby forming "Picric."

Now comes the question—What is the best varnish to use? The obvious answer is "That which has passed the government analytical test." But it does not follow that "passing the test" is enough. This test is principally to ensure that no lead is in any of the ingredients used in making up the varnish—not even a "trace" of lead. It may pass the test well enough, and yet, may not function properly when applied to the shell. Again, the varnish may be good, but may not be applied in the right manner. Or the shell may not have been properly cleaned before being varnished. These points are all worth consideration and might be discussed individually.

How to Clean Shells

Let us begin at the beginning and take the question of cleaning first. Some firms wash the shell thoroughly with gasoline or benzoline and then dry it out with rags. This is a method that often causes trouble partly owing to the poor quality of the gasoline of the present day. Some of it is more like kerosene or coal oil than gasoline, and possesses a kind of grease which remains on the steel in a white film after the spirit has evaporated.

Then, again, the rags that are used should not have any lint on them because this is sure to stick to the steel. It is very important to be sure that the compressed air—if such is used for drying out—is quite dry because, if not dry, spots of rust will form on the steel after the varnish has been applied, and has dried or been baked.

Some firms merely blow out the shell and wipe it thoroughly with a succession of rags. This method never brings success. Other firms wash the shell in a solution of soda or soda preparation used at almost boiling point. This is not approved of on account of the soda getting in between the steel and copper band, and thereby forming verdigris. Besides this, it is almost impossible to remove all traces of the soda, and as a natural consequence neither the varnish inside, nor the paint outside, will adhere to the steel.

The best known method, the one which is sure to bring the best results, is the following—it is of course a little more expensive to operate, but when one comes to add so much for every shell that has to be "rectified" for varnish—i.e. revarnished—perhaps the more expensive way is the cheapest after all. Wash the interior with a jet of steam hot solution of one of the cleansers permitted by the government inspector. Then dry it, after washing it in perfectly clean hot water, by using 1st, a mop, 2nd, a dry cloth, 3rd, a clean dry cloth, 4th, chamois skin, 5th, a perfectly clean chamois—then apply the varnish while the shell is warm, and you will get a varnish coat that is absolutely smooth, clean, and free from overlapping.

Applying the Varnish

Some firms prefer the spray or varnish gun, while others like the pouring method best. Splendid success has been attained with each method, but with the pouring there is invariably more trouble caused by the varnish getting into the threads in the nose. This must of course be completely removed, thereby causing more work and discontent—because it certainly is a tedious job.

There is very little airdrying varnish used now-a-days, because the authorities in England do not approve of it. The varnish used, should be copal baking. There are two sorts—clear and dyed. Take my advice and always use the clear stuff. All imperfections and dirt can be at once seen through the clear

varnish, but with the colored stuff imperfections may be and are covered up. It has been known where, in certain cases, this covering up with a second coat of the dyed varnish has been done on purpose, to save the trouble and expense—about 30c—of revarnishing the shell. No examiner, if he would be considered any good at all, will pass any varnish that is in slightest degree faulty, or of which he is not absolutely sure. If he is in the slightest doubt whatever, he should have the shell varnished again, the old varnish being thoroughly removed, whether the firm like it or not. The varnish question is too important to be trifled with.

In the earlier days of shell making, it was permissible to use air-drying varnish. This has, however, been done away with, except in some special cases, because it was found that it cracked and peeled off after the shell had been stored for some time, thereby leaving bare spots of steel exposed to the action of the explosive. It has been found much better, and safer to use copal baking varnish. This, as I said before, should be applied while the shell is warm. The shell is then placed in an oven and baked for from 2 to 2½ hours at a temperature of 300 deg. F.

Baking Hints

When a number of shells are placed in the oven at one time, the shells being cold naturally reduce the temperature of the oven, so that it is very necessary to note exactly how much this is reduced and give the shells the extra time required. The shells should not be left in the oven too long. If this is done the varnish will come out burnt and consequently flake off, which is just as bad as air-drying. The steel also takes on a burnt color and the inspector will turn the shell back to be polished with emery cloth, to enable him to give it a proper visual examination.

Great care and constant watchfulness is therefore required when baking, and a firm is wise to appoint a man to act as inspector for them who not only thoroughly understands the varnish question, but who will give his entire attention to the work.

If a shell is not properly varnished and is sent out to be re-done, every scrap of the old varnish must be removed by blasting, or otherwise, and the old varnish being baked hard is sometimes difficult to remove. Not only this, the time taken in re-doing work that should have been properly done at first means money lost to the firm and owing to the extra time taken in re-baking sometimes a whole shipment is held up for the sake of half a dozen shells.

Sometimes the varnish takes a mottled or piebald appearance. This is mainly due to spots of greasy gasoline, and means that while the spotted portion may be covered the covering is much thinner on the spots than on the remainder. Therefore this would constitute a dangerous varnish to pass.

A great deal of trouble is caused by the varnish "running"—overlapping. The specifications call for a "smooth continuous coat," therefore if an overlapping or wave develops, the shell has to be re-done. Patching up faulty places in the varnish is not acceptable because these patches bake hard, and cause roughness on the surface.

Another good point to remember, is, never let your varnish thicken up. As it is against the rules to "thin" it out, a firm will be wise if they buy their varnish in one gallon cans, and not by the barrel.

Conclusion

To sum up—The points to watch are perfect cleanliness before varnishing, or the varnish will not adhere. Apply the varnish while the shell is warm. Whether using the "gun" or pouring method, watch for overlapping. Be exact in the baking time. Don't do any "patchwork." When cleaning the threads be careful not to let drops of "Taxite," "Brantine," or other strong varnish remover fall into the shell, because if you do that shell will have to be re-varnished.

When one thinks it all over, one sees how simple the whole thing is, provided of course, that the men, boys, or girls, in the varnish room, are interested in their work. As remarked at the beginning of the article, the varnish question is one the importance of which cannot possibly be too strongly impressed on the minds of all concerned—manufacturers, shop inspectors, yes, and government men too. A chief examiner is held personally responsible on the varnish question and he is a fool if he yields one fraction of an inch in this matter.

WHEELS FOR GRINDING STELLITE

CONSIDERABLE interest has been shown lately in the grinding of stellite. Much depends upon the personal element and grinding conditions. A recent number of *Grits and Grinds* contained some recent experiments conducted in laboratories and in some shops where considerable of this material is being used, which may prove helpful to those who have had stellite grinding as one of their problems. The tests were conducted in order to answer the following questions:

1. Do the different grades of stellite require different grinding wheels on the same operation?

2. What grains, grades and abrasives are most satisfactory for cylindrical grinding, surface grinding, tool and cutter grinding and cut-off grinding?

3. Is there any advantage in wet grinding?

4. Are wheels commonly employed for hardened carbon and high speed steels satisfactory for grinding stellite?

5. Will finer grits be better than those usually employed for steel tools?

The conclusions reached by these laboratory reports and by reports from salesmen of the various territories where stellite is ground successfully are as follows:

1. The No. 38 alundum is by far the most desirable abrasive for the precision operations and most of the tool grinding. However, regular alundum is satisfactory for the cut-off grinding and may be used for free-hand grinding of heavy tools.

2. Vitrified wheels should be used in preference to silicate or elastic.

3. No. 3 stellite seems to require slightly finer and softer wheels than No. 2 stellite.

4. The advantage of wet grinding, especially on the precision grinding operations, is in more rapid and accurate sizing of the work and slight retardance of glazing. Finish is also somewhat improved. On tool grinding no pronounced improvement in wet grinding, except that it keeps the wheel face cleaner and enables the operator to handle the tools easier.

5. Wheels used for stellite are interchangeable to a certain extent with those used for high speed steel grinding. This applies especially on the precision grinding operations. On the free-hand operations, our laboratory tests call for No. 38 alundum, slightly finer and softer than would be used on steel tools.

6. The general tendency is undoubtedly toward finer grits, while grades follow other conditions which vary greatly in different shops. No. 46 grit is the coarsest size which produce a satisfactory finish in most cases.

7. For cylindrical grinding we suggest 3846-L on No. 2 stellite and 3846-K or 3860-J on No. 3.

8. For surfacing with straight wheels we suggest 3836 and 3846-H on No. 2 stellite and 3846 and 3860-H on No. 3 stellite. For surfacing with cup wheels approximately the same wheels may be used, but outside conditions will undoubtedly call for softer wheels on the cup wheel grinding operations.

9. For tool grinding we suggest 3860-M or N as found satisfactory in our tests. However, outside reports indicate the same deviation from this, namely, 36 and 46-O, also 46-K and 60-J regular alundum.

10. For cut-off grinding, 60-3 or 46 grades 4 and 5 alundum elastic should be used.

These suggestions and recommendations may only serve as a starting point in many instances. Outside conditions and practice are so varied that it is impossible to develop standards readily. Undoubtedly, as stellite comes into more general use, more experience in grinding will be obtained and then more definite statements and conclusions can be drawn.

MANUFACTURING ACTIVITIES IN THE U. S.

THE effect of three years of war upon the manufacturing industries of the United States can now be measured, in some degree at least, by certain official data which renders possible the comparison of conditions in 1917 with those of 1914. An analysis by the National City Bank of New York of figures of export of manufactures compared with those of 1914 indicates a wonderful development

in the exports and evidently a large growth in the manufacturing industries of the country in that short period.

Manufactures exported in the nine months of 1917, for which figures are now available, are more than four times as great in value as in the same months of 1914. Finished manufactures ready for consumption exported in the nine months ending with September, 1917, amount to $2,063,000,000, against $466,000,000 in the same months of 1914. Manufactures for the use in manufacturing are $957,000,000, against $262,000,000 in the corresponding months of 1914. Thus the total of manufactures exported in nine months of 1917 is $3,020,000,000, against $728,000,000 in the same months of 1914.

Export Figures

While this very large increase occurs, to a considerable extent, in strictly war material, it also applies to a large proportion of the classes of goods produced by our manufacturers. Iron and steel manufactures as a whole, for example, show a total export value in the eight months ending with August, 1917, of $803,767,000, against $140,246,000 in the corresponding months of 1914, being thus six times as much in value in 1917 as in 1914. Manufactures of cotton show in the eight months of 1917 total exports $91,907,000, against $34,028,000 in the same months of 1914, having thus a little more than trebled in value of exports in the period in question. Cars and carriages, including in this term freight and passenger cars for railways, automobiles, both freight and passenger, aeroplanes, motorcycles, and bicycles, show a total for the eight months of 1917 of $111,073.000, against $30.361.000 in 1914, having thus nearly quadrupled in value in the period under consideration. Copper of all sorts exported in the eight months of 1917 was $349.676.000, against $89,713.000 in the same months of 1914. having practically trebled in value in the three-year period.

Paper and manufactures thereof exported in the eight months of 1917 amounted to $26.841.000. against $13,337.000 in 1914. Tinplate showed a total in 1917 of $24.211.000, against $2.950.000 in the same months of 1914. Refined sugar, which has seldom formed an important factor in the export trade, showed for the eight months of 1917 exports amounting to $48,421,000, against $2.595.000 in the corresponding months of 1914. The wood and lumber industry is apparently the only one of the great manufacturing industries which has not prospered as a result of the war, the total value of wood and manufactures thereof exported in the eight months of 1917 having been but $41,832.000, against $61,279,000 in the same months of 1914.

Import Figures

Evidence of the activities of our manufactures is also shown by an examination of the import figures. The bank's statement shows that the total value of raw material imported for use in manufacturing in the eight months of 1917 is $886,683,000, against $436,234,000 in the same months of 1914, having thus practically doubled in the three-year period. Manufactures for further use in manufacturing imported in the eight months of 1917 amounted to $346,287,000 in 1917, against $198,584,000 in the same months of 1914, having also nearly doubled in the three-year period. These two great groups of manufacturing material show for 1917 an aggregate of $1,051,000,000, against $635,000,000 in the same months of 1914. Raw cotton imports in the eight months of 1917 amounted in value to $35,182,000, against $18,025,000 in the same months of 1914. Fibres in the 1917 period amounted to $55,462,000, against $36,291,000 in 1914; hides and skins in 1917 $166,679,000, against $86,807,000 in 1914; India rubber and substitutes thereof in 1917 $170,588,000, against $50,088,000 in 1914; raw silk in 1917 $111,787,000, against $63,407,000 in 1914; pig tin in 1917 $43,746,000, against $24,334,000 in 1914; and wool in 1917 $134,139,000, against $50,521,000 in the corresponding months of 1914.

While no official census of manufactures in the United States has been taken since the year 1914, the very large increase in production is illustrated not only by the above figures of increased imports of manufacturing material and increased exports of manufactures, but also by the fact that the quantity of pig iron produced in the country in the eight months ending with August, 1917, was 25,660,000 tons, against 16,355,000 tons in the same months of 1914, and that the quantity of cotton used by the factories of the United States has increased approximately 25 per cent. in the same period indicates that the actual quantity of manufactures turned out has enormously increased, while the advance in prices has still further increased the total value of the output as compared with 1914.

A. S. M. E. ELECTS NEW HEAD

MR. CHARLES T. MAIN, of Boston, a consulting engineer, who has served in several public offices for the purpose of advancing the idea of good government, has been elected president of the American Society of Mechanical Engineers, which includes in its membership 8,500 mechanical engineers.

Mr. Main was born in Marblehead, Mass., in 1856, and was educated at the Massachusetts Institute of Technology, from which he graduated in 1876. After extended service in the engineering field he became. in 1907, partner in the consulting firm of Dean and Main, with offices in Boston.

Among the numerous industrial, steam power and water power plants which Mr. Main has designed and successfully completed, might be mentioned the Wood, Worsted and Ayer Mills in Lawrence, Mass., and four hydro-electric developments for the Montana Power Co., aggregating about 280,000 horse-power.

He is a member of the American Society of Civil Engineers and a number of other engineering and technical societies.

B. C. FISHERIES

THE report of the British Columbia Fisheries Department for the year ended March 31 has been issued.

The report shows that the value of the fishery products of British Columbia for the twelve months was $14,538,320, which represented 40.54 per cent. of the fishery products of the Dominion, which totalled $35,860,708. The British Columbia production exceeded that of Nova Scotia by $5,371,469.

Notwithstanding the fact that the fisheries of the province show an increase in value of $3,023,234 over that of the previous year, the quantity of the leading species of fish caught was notably less. The gain in value is due to an increase in the price received for the catch.

Of the fish marketed, salmon was valued at $10,726,818; herring, $1,009,708; halibut, $1,972,000; cod, $300,049; oysters and clams, $98,180. There were twenty-one species marketed.

PULPWOOD REFORESTRY

THAT the greater portion of the cut-over pulpwood lands of Canada will take from 30 to 100 years to reforest themselves instead of about 20 years, as lumbermen have supposed, is the statement made by Dr. C. D. Howe, of the Faculty of Forestry, University of Toronto, to the Commission of Conservation.

Of special significance, in view of a possibility of the diminishing coal resources of the United States soon forcing Canadian railways to use hydro-electric energy for traction purposes, was the address of S. T. Dodd, traction expert of the General Electric Co., Schenectady, N.Y. He fully described the electrified western section of the Chicago, Milwaukee and St. Paul Railway, which covers a distance of 440 miles, and has found electric traction to be considerably cheaper than steam.

ALCOHOL is made from the cheapest starchy materials available, such as potatoes, maize, turnips, molasses. The raw material is mashed with about 5 per cent. of malt, and fermented in the usual way. After distillation in a Coffey still, the spirit is diluted with water, filtered through wood charcoal to remove fusel oil and redistilled through a fractionating column. The products are separated into three grades: first runnings, and first and second quality spirits. The first runnings, containing about 95 per cent. of alcohol with a small quantity of aldehyde, may be used for burning and give rise to no deleterious effects. The first and second qualities, which are 96 to 97 per cent. in strength and contain only traces of aldehyde—the second quality also containing a small quantity of fusel oil—are known as silent spirit, because they afford no evidence of their source. These qualities are used for drinking purposes—liqueurs and factitious brandy and whiskey—and for pharmaceutical preparations.

OVAL TURNING

THE article on elliptical lathe work appearing in a recent issue of this journal reminds me of an attachment used some time for turning a few irregular shapes, the dimensions of which were not required to be very accurate, but had to conform to the desired throw of the difference of the minor and major axis. To hold ourselves to the dimensions given in the article of recent date, where the major axis was 7½ inches and the minor axis 4 inches, the oval was developed from the oscillating motion derived from an eccentric, this being transferred to a reciprocating movement of the cross slide by suitable linkage. The arrangement of the device as attached to a lathe is shown in Fig. 1, the work A being held in a chuck secured to the face plate of the machine. The bracket B was secured to the back of the carriage and from the lower support carried the lever C, the upper end of which contained a small hardened steel piece D, the point bearing on the surface of the eccentric E. This eccentric, with a throw of 1½ inches, or the difference between the major and minor axis, was keyed to the shaft that turned in the bearings of the fork bracket B. This shaft F was driven by suitable gearing arranged at the rear of the lathe, so that the train could be set up to suit the work required. The fulcrum of lever C was located in a vertical midway position between the two extreme points of travel of the controlling point of the steel block D. Connection was made between the device and the cross slide by means of the rod G, the small bracket H being secured in a position to suit the size of the work. With the cross feed screw removed, tool adjustment is made by means of the compound rest; contact of the point on the eccentric being maintained by the action of the small cable I and the weight K, the former passing over the small pulley located on the side of the bracket J. Better results are obtained when the strain is equalized by using a cable on either side of the cross slide.

The action of this device is illustrated by the graphical sketch, Fig. 2. It must be understood that to derive an oval or ellipse from an eccentric in this manner it is necessary that the eccentric make two revolutions while the work is making one. To determine the approximate outline of the oval that the attachment will produce draw two circles representing the two diameters of the piece required, in this case 7¼ and 4 inches. The centre of motion of the eccentric will be at X. From this point divide the circle into 8 equal parts, each having an angle of 45 deg. The intersection of the radial lines with the eccentric circle will be the points on the circumference in contact with the controlling point for each 45 deg. of movement. From the various intersections, using X as a centre, draw arcs, cutting the horizontal diameter at A, B, C and D, these points representing the lateral travel of the cross slide for each 45 deg. passed through by the generating eccentric; and as the work is revolving at one-half the speed, it will pass through an angle of 22½ deg. in the same period of time. Therefore, transferring these distances to the portion of the line A-B lying between the two circles, and describing arcs cutting the various radii in the points 2 ft., 3 ft., etc., will give the points through which the curve can be developed. Fig. 3 shows the outline that would result if the eccentric were used in the ordinary, where the centre of the connecting rod passes through the circle 1-b-d-b. If the connecting rod were of infinite length the developed outline would be more elliptical in shape than here shown.

MARINE USES OF CONCRETE

By L. E.

BESIDES being used for the construction of ships of all classes, there appear to be indications that when normal conditions return ferro-concrete will be used for lighters, floating docks, buoys and other floating objects where weight does not play a very important part. The weight of ferro-concrete would, however, detract from the carrying capacity of sea-going vessels and make it difficult for ferro-concrete vessels to compete with steel vessels in normal times. Experience from ferro-concrete construction ashore is not directly applicable to vessels.

Fixed structures, as a rule, are only subjected to a load the maximum of which is known, and which only acts in one direction, whereas the load to which a vessel may be exposed cannot directly be calculated, and its direction is constantly varying, especially in a turbulent sea. Under these circumstances, pending fresh experience, the strength of a ferro-concrete vessel must be determined by comparison with that of a steel vessel of the same type and dimensions. That, however, is a difficult problem, as a steel vessel, on account of peculiarities in construction and building, in some directions may have more material than is necessary from general strength considerations, and also because several qualities of concrete, which it is necessary to know in order to make fairly reliable comparisons, with steel vessels, are not yet sufficiently ascertained.

The actual building process of a ferro-concrete ship is such that the quality of the material and the workmanship cannot be controlled with the certainty obtaining for steel vessels. The tensile strength of concrete is very limited. Tensile stresses must, therefore, be carried as far as possible by the reinforcing steel. In a floating structure, however, the concrete cannot be altogether guarded from tensile stresses, which are apt to create small cracks. Such cracks may also arise during the setting of the concrete. On shore they are generally considered to be of minor importance, but it is by no means certain that such cracks may not play a different part in a vessel exposed to varying stresses and the effect of penetrating sea water.

THE GYROSCOPIC COMPASS

By C. T.

THE French physicist Foucault was the first to analyse the phenomenon of the gyroscope which underlies its application to the compass. Foucault's efforts, which were made in 1851, resulted in the deduction of two laws: firstly, that a rapidly rotating wheel suspended with freedom to move about all axes will maintain its plane of rotation in space; and secondly, that a gyroscope suspended will tend to process or turn about the vertical axis in an effort to place its plane of rotation coincident with that of the earth. The question of utilising this phenomenon in an instrument which would seek and maintain the true north meridian, regardless of position, speed or course, or oscillating movement of the body on which it was mounted, involved a great many problems.

Early in his work the American inventor Sperry became convinced that the major problem was one of pure engineering in devising a suspension which would be frictionless about the vertical axis, allowing the gyroscope to turn with perfect freedom in its effort to seek the meridian. The problem was solved by suspending the gyroscope or sensitive element from a strained wire, the top of which is carried in a frame surrounding the gyroscopic element, the frame being oriented by an electric follow-up system in such a way as to cause the frame to follow any tendencies of the gyroscopic element to move about the vertical axis.

Numerous other problems quite as difficult of solution were encountered. Perhaps the most difficult of all was that involved in so suspending the sensitive element that it would be unaffected by the acceleration pressures arising from movements of the vessel on which it was mounted. In developing that point it was necessary to collect a large amount of data relating to the time taken by all classes of vessels to accelerate from one speed to another. From this data, the acceleration pressures were calculated and actually applied to the experimental instrument by means of weights allowed to act for a certain length of time. The Sperry Gyro-Compass as it is in service to-day demonstrates how all these difficult problems have been solved.

A TALE OF A RUN-DOWN SHOP

By H. Middleton.

WHEN Bob Philips undertook the job of rehabilitating the Drew Hat Co. he thought he would have a great deal of hydraulic work to do; in fact, it was because of his experience as a machinist on such work and his ability as an organizer that the second generation of Drews hired him. The elder Drew had founded the business shortly after he came to America, and having always made money in it, had been satisfied to let things go on as they were; but after his death the sons decided on a more up-to-date policy.

The hat business is a big user of presses and steam—hydraulic, steam. lever, and toggle presses. Philips found the hydraulic presses in good shape, also the accumulators, pumps, and piping; they were of English make, and had been in charge of a Yorkshire man, who took pride in them because of that. But the lever and toggle presses being so "simple," had had little or no care, simply because they had been left to the unskilled hands who worked on them.

A saving of over $500 on the first trip through the press room is rather unusual, but it was made in this instance. The hand-operated presses are all counterweighted, and Philips noticed an unusual form of counterweight, consisting of a box filled with junk. His investigation led to an examination of the junk, which proved to be spelter and lead—and from 150 to 300 lbs. of it on every machine. The substitution of a baser metal scrap for the spelter made a good start. Further savings were made on the overhead by such simple means as washing the windows and so cutting down the light bill; having the floor swept in the corners and under the presses, netting an unbelievable heap of well chewed tobacco quids, which sold for $15 for fertilizer; and in having the rusted joints of some of the presses that "wouldn't work" loosened up and oiled, thus increasing the capacity of the press room twenty per cent.—which goes to show that there are homely ways of making money without spending it.

FORETHOUGHT AS A SAFETY FACTOR

By S. H. R.

EXPERIENCE is one of man's best educators but it is very often a hard taskmaster. The bulk of the knowledge that most of us have acquired has been doled out by this ever existing and often unrelenting teacher; and it is probably well that it is so, as many of the lessons thus learned are more likely to make a lasting impression upon us than if the same were handed down to us as a hereditary legacy. How many men to-day profit by the experience of their elders? The majority of us are like the child that must touch the fire even after being told that by doing so he will get burnt. Shop accidents are more often caused by thoughtlessness or carelessness on the part of the workmen than from the faulty condition of the plant equipment. The human element is the most perverse factor in the safety problem of shop management. We are prone to criticize the actions of those about us, but too often fail in a proper analysis of our own accomplishments. A frequent cause of injury to machinery is the impulsiveness of the operator, this trait being particularly pronounced in young apprentices and inexperienced mechanics. The first duty of a workman, when placed upon a new machine, is to become familiar with its operating mechanism.

Many machine tools of to-day are equipped with every facility for maximum efficiency, and at the same time relieve the workman of much of the physical and mental effort incidental to the manipulation of equipment of the last decade. This does not mean that it requires a less skilful operator to do effective work on a modern machine, as it is probable that closer attention is now required than ever before, owing to the greater possibility of becoming confused by the various knobs and levers. The semi-automatic nature of present day metal working tools has, however, destroyed much of that reasoning power that in former days was so common in the average workman. Apprentices and older mechanics should endeavor to cultivate the habit of speedy but accurate forethought in the discharge of their duties, as a mental review of possible developments will often prevent injury to a machine or an operator.

To illustrate by an example: Some time ago a young mechanic was boring piston ring castings, which in the rough weighed about 80 lbs. After completing

the work on one of these he placed another one in the chuck without removing the boring tool from the tool-post. In order to center the work—a four jaw chuck being used—one of the jaws was slackened, leaving the casting supported by two others; turning the work through an angle of 180 deg., and with the right hand placed on the upper portion of the ring to steady it, he started to adjust the casting to position. One of the side jaws, however, had apparently been resting on a small lump, so that the downward pressure from the top screw released the work, causing the piece to fall from the chuck, and catching the man unprepared his hand was caught between the tool and the work, resulting in a badly lacerated finger. A little forethought in removing the tool, or supporting the work while setting, would likely have prevented the injury sustained. Accidents occur every day through over impulsive action on the part of workmen, which a moment's forethought would oftentimes prevent.

ELECTRIC DRIVE FOR WARSHIPS

By D. Street.

IT is confidently expected by those who favor electric transmission for ship propulsion that the electrically-driven cruisers and battleships now building for the American Navy will demonstrate conclusively that the electric drive is superior to all others for naval vessels of this class. The features upon which this confidence is mainly founded are the maintenance of a high efficiency at all speeds, and the diminished risk of a vessel being temporarily crippled by a breakdown in the engine room.

No attempt is made to claim for electrical transmission as high an efficiency at full power and speed as can be obtained from the geared drive. In the new battle cruisers the losses from turbine to propeller shaft will be about 7 per cent. at top speed. It is conceded that at full speed a geared drive will show a better figure than this—better, perhaps, by 2 per cent.—but a battleship is only on full speed for a fraction of its time, and the normal cruising speed requires only about one-tenth of full power. It is here that the electric drive is expected to show great advantages. At light loads the efficiency of the geared turbine equipment falls off considerably owing to the reduced thermal efficiency of the main turbines themselves, and to the relatively greater drag of gearing, bearings, reversing turbines, and idle parts of the main turbines.

Even though special cruising turbines are fitted, the efficiency at cruising speed must be low, for such turbines cannot have the efficiency of a single large main turbine, and they add still more to the drag. With the electric drive the transmission efficiency can, on the other hand, be kept equally good at all speeds; the number of motors and turbines used can be adapted to the demand for power, and this gives a very important gain in economy at all speeds below the maximum. At 19 knots only one turbine is required to drive the ship, and it runs at full speed instead of at half-speed as it would in a geared equipment. Thus the steam efficiency at 19 knots—a desirable cruising speed—is equal to the best attainable at any speed, and as cruising economy gives increased cruising radius without renewal of fuel supplies, high efficiency at this speed is a matter of the greatest importance.

Breakdown Possibilities

In regard to the risks of complete breakdown, it is pointed out that in the geared equipment each shaft has a system of turbines, gears, bearings, thrust-balancing devices, and lubricating systems, all mechanically locked together, and that with high speed machinery any kind of trouble with any of these parts generally necessitates the immediate stoppage of the whole system, whilst if a breakdown has occurred it may be necessary to stop the ship while the wreckage is cleared away and the shaft uncoupled, after which the idle propeller would still act as a very serious drag on a fast vessel. In the electrically-driven ship there is no mechanical connection of the shaft to anything but the rotors of the motors, which cannot be subject to mechanical interference.

The shafts are subject to the same possibilities of bearing or thrust trouble as shafts in other ships, but the presence of the motors does not increase this danger, and the speed being low, it is remote in any case. With this equipment any motor, generator, or turbine, if in any kind of trouble, can be instantly disconnected without stopping the ship and with only a small loss from the highest speed capacity. The versatility of transmission constitutes one of the most important advantages of electric drive in such a ship. With one motor out of eight in trouble only one-eighth of the maximum capacity is lost, and the ship's maximum speed is impaired by only about one knot. If a generator or turbine is in trouble the maximum speed is reduced only about two knots. With two generating units and four motors out, the ship can make 26 knots, and with three generators and four motors out she can make 19 knots. If parts give trouble they are simply cut out and repaired at leisure, or as opportunity affords.

Self-Contained Reverse

A further point made is that the electric drive dispenses with the need for reversing turbines and eliminates complications which they involve. Importance is also attached to the large gains in fuel economy afforded by super-heat, and it is expected that the demonstration of the ability to use safely high degrees of super-heat may constitute one of the most important reasons for adopting the electric drive. In opposition to these claims can only be advanced one, that of greater weight. This can be discounted on the heavy ships, where protection is of vital importance. On the light fast vessels, such as destroyers and scouts, where no protection exists, everything is sacrificed for speed, and for such vessels the mechanical reduction gear stands pre-eminent to-day.

VELOCITY OF SOUND IN SEA-WATER

By T. J.

AS is well known, the aberration to which aerial sound signals are subject makes the transmission of sound through water a much more desirable medium for the exchange of signals, but there is a certain amount of error always found in short distances from the shore when a ship is endeavoring to find her distance by echo. The elasticity of the water is a great determining factor, as the velocity of sound through a medium is equal to the square root of the quotient found by dividing the elasticity of the medium by its density. The elasticity of sea water is 2.02 by 10.10, and its usual density is 1.03; and the computed velocity of sound through the ocean is therefore 1,400 metres, or 4,593 feet per second. Owing to the uncertainty of locating the place from which the sound waves are reflected to form an echo any method of finding distances in navigation by means of submarine echoes is not at all serviceable. In the location of sound signals every effort is made to avoid the formation of echoes on account of the uncertainty which their presence produces in locating the submarine signal.

U. S. ENGINEERS DISCUSS WAR TOPICS

WAR topics predominated at the convention of the American Society of Mechanical Engineers, recently held at the Engineering Societies Building, 29 West 39th Street, New York, the engineers discussing the shipbuilding problem, the aircraft problem, the fuel problem, the agricultural problem, etc.

Methods were considered whereby the problem of fuel conservation will be met either by compelling coal consumers to execute such measures of economy as the authorities prescribe, or else by disseminating correct information regarding the mining and consumption of coal, accompanied by an appeal to the patriotism of the consumers.

Such subjects as expenses and costs, accident prevention, labor turnover expense, and the relation of industrial management to engineering, were discussed. Dr. John A. Brashear, past-president of the society and widely known in connection with the development of the modern telescope, addressed the members and their guests, taking for his subject "The Science of the Beautiful in Commonplace Things."

Honorary membership in the American Society of Mechanical Engineers was conferred upon Major-General George W. Goethals in recognition of his achievements in engineering, and Ex-President Taft gave an address on "The War's Call to Professional Men." These functions, which were held in the impressive auditorium of the engineers' building, were followed by a reception to the new president of the society, Mr. Charles T. Main.

PROGRESS IN NEW EQUIPMENT

There is Here Provided in Compact Form a Monthly Compendium of Shipbui ding and Marine Engineering Auxiliary Product Achievement

PNEUMATIC LIGHT FORGING HAMMER

EXTENSIVE experience in the design and manufacture of pneumatic equipment has enabled H. Edsil Barr, Inc., Erie, Pa., to develop a pneumatically operated light forging hammer which possesses all the desirable features of power hammers in addition to being independent of shafting and belts.

The weight of the complete hammer is 1,200 lbs. and it is expressly suited for handling all sorts of light miscellaneous tool dressing, forging, welding, straightening, blacksmithing, etc., ordinarily done by hand, thus avoiding the uneconomical tying up of a large hammer, and providing a hammer readily movable to the work in shipyard, shop, mine, quarry or contract work.

The main frame consists of a heavy

PNEUMATIC LIGHT FORGING HAMMER.

anvil portion cast solid, and having a rigid integral box housing supporting the working parts. Cylinder is bored and reamed and has a key across the entire face of frame in addition to four bolts. Ports are large and direct and main valve is quickly accessible through cover plate on valve chest. Main stuffing box gland is of ample length, is bushed with bronze and made in halves for easy removal.

Heat treated vanadium alloy steel is used for the one-piece piston and rod; the ram head and guide shoe are made of a single open-hearth forging, and have a long taper fit on the rod. Vanadium alloy steel is used for the valve gear pin inside of ram. Liberal wearing surface is provided on the guides which extend down as far as practicable. Dies are of the plain forging type of special tool steel suitably tempered. The upper die is dovetailed and keyed to ram, while lower die is dowelled to anvil.

Operation is controlled by pressure on the foot lever, the speed depending on the air pressure and thickness of stock—from 150 to 200 blows per min. The higher speed automatically occurs on thicker sizes of the hammer's range which is from 1/16 in. to 2 in. inclusive. No adjustment is required in striking and reversing on any thickness within the above capacity, speed and force being controlled directly by amount foot lever is depressed. Hot iron 2 in. square is readily worked.

The hammer occupies a floor space 14 in. by 24 in.; is 66 in. high; dies 2¼ in. by 4½ in.; requires 30 cu. ft. free air per min. at 90 lb. pressure per sq. in. for steady operation at full speed.

UNIVERSAL CUTTER AND TOOL GRINDER

A UNIVERSAL cutter and tool grinder of modern design and adapted for a very wide range of tool room work is built by Wilmarth & Mormon Co., Grand Rapids, Mich. Their No. 1 Universal grinder is shown in the accompanying engraving, and has eight speed changes for table travel graduated from 12 in. to 75 in. per min.

The travel and reversing mechanism is contained in a gear box at the left of the saddle and somewhat to the rear. It is a complete unit in itself and is so arranged that it can be attached to the hand feed machines of this type already in service with very little work. It is driven by the two step cone pulley at the extreme left, four speeds being obtained on each step.

UNIVERSAL CUTTER AND TOOL GRINDER.

The gearing from the box to the table is arranged so that it can be entirely disengaged leaving the table free for operation by the handwheel at the front of the saddle or the lever at the rear without operating any of the power feed mechanism which drives the table.

The front of the table is provided with a tee-slot which carries adjustable dogs for operating the reversing mechanism at the desired points on the work, allowing the operator to shorten or lengthen the stroke as desired.

All of the mechanism is entirely self contained with none of the working parts exposed to grindings or dirt, and all of the gears are run in a bath of oil to insure long wear.

AMPLE STEEL SUPPLIES FOR THE WAR

AMPLE supplies of steel for all the Government's war needs were assured to the War Industries Board by representatives of the largest steel mills in the United States. They proposed, however, a different system of allocating orders to take into consideration idle capacity, the fuel supply and transportation conditions. In line with this suggestion, hereafter placing of orders will

be centralized in the hands of J. L. Replogle, the board's steel expert, and it is believed that deliveries will be expedited. Ways and means of expediting production of the war instruments which are to bring victory in the war occupied the attention of the conference almost exclusively during the two hours the meeting was in progress. Whether the filling of war orders would leave sufficient steel for private industries was declared to be "another question," which none of those present would answer definitely.

CANADIAN RAILWAY CLUB HELPS HALIFAX

THE Canadian Railway Club meeting at Montreal last week decided to forego their annual dinner this year, owing to the general conditions that prevail at the present time. In view of the fact that the war is still at its height and the recent devastation at Halifax, it was thought advisable to postpone the event. By a unanimous vote a grant of $200 was passed for the relief committee of the stricken city, the money being wired while the club was in session.

DOCTORS ARE REALLY ENGINEERS

COL. W. O. OWENS, in charge of the Motion Picture Department of the American Medical Museum in Washington, under the direction of General Goorgas, declared at the recent convention of the American Society of Mechanical Engineers that he had come to look upon doctors and medical men as biological engineers, inasmuch as their chief business was to keep the human engine in perfect working order. His statement was emphasized by Major Frank D. Gilbreth of the Engineers Officers' Reserve Corps, who described how the soldiers crippled in the war are provided with means for performing useful industrial work and making themselves self-supporting. In the course of the discussion on the crippled workers, illustrations were shown of men putting on their trousers with blacksmiths' tongs, one-armed men driving nails with magnetic hammers quicker than two-armed men could with ordinary hammers. Major Gilbreth urged the universal employment of cripples in work which they could perform and said it would be socially indecent for employers to give a job to a normal person when a cripple could just as well do it. He told how efficient cripples were in industrial plants.

WELDING WORK DISCUSSED BY RAILWAY MEN

AT the last regular meeting of the Canadian Railway Club a paper was read on "Oxy-Acetylene and Electric Welding in Locomotive Work" and the discussion that followed proved to be the most interesting and instructive that the members have so far experienced. The center of the discussion hinged on the advantages and disadvantages of the lap and butt weld as applied to construction and repair of fire-boxes and flue sheets. While no definite conclusion was arrived at considerable data and information were brought forward that will be of value for future operation of this class of welding.

SOUTHERN CANADA POWER CO. DEVELOPMENTS

THE map accompanying the annual report of Southern Canada Power Co. recently issued shows that the company's operations cover an exceptionally wide range of territory, doubtless the largest east of the Niagara power zone. On the south power is carried across the international boundary into Derby, Vermont. On the west the transmission lines approach as near to Montreal as St. Johns, Iberville, St. Hilaire and Beloeil. On the north Drummondville and adjacent municipalities are tapped, while on the east the principal points of consumption are Sherbrooke, Lennoxville, Richmond and Compton. These distances are approximately 70 to 75 miles east and west, north and south.

It is quietly but gradually developing into an important development, and is extending a network of power wires throughout the south-eastern section of the Province of Quebec, and working up the available hydro-electric propositions in that area.

The report states:

"Considerable progress has been made during the year in the consolidation of the subsidiaries acquired, as referred to in the last report. Since then the company has purchased the municipal plants of the City of Granby and the Town of Bromptonville, and is now engaged in the joining up of its various isolated properties.

"The company at present has under construction about eight-five miles of transmission lines from Sherbrooke to Granby and Cowansville, from Sherbrooke to Bromptonville, and from St. Cyrille to St. Germain through Drummondville, with the necessary sub-stations and distribution systems.

"The power development at Richmond, Drummondville, Foster and Granby are being considerably improved and enlarged and put into shape for the most economical operation, through the transmission lines, with the other plants of the company.

"A great deal of work has been done in connection with the engineering investigation of the company's water powers, and additional riparian and other rights have been acquired, so that practically all such work usually preliminary to such developments is now completed."

A HIGH speed steel alloy recently patented in Great Britain has the following composition: Carbon, 0.5 to 0.8 per cent.; molybdenum, from 6 to 10 per cent.; chromium, from 3 to 6 per cent.; vanadium, 0.15 to 2 per cent.; manganese, 0.2 to 0.4 per cent., and silicon, 0.2 to 0.4 per cent. The amount of vanadium may be lowered and partly replaced by cobalt, of which latter element from 0.5 to 3.5 per cent. may be incorporated.

Screenings

Little Tommy—"Say, papa, what is meant by beastly weather?"

Papa—"When it's raining cats and dogs."—Brooklyn Citizen.

The boy came into the house weeping and his mother was naturally solicitous. "What's the matter, Willie?" she asked.

"The boy across the way hit me," he replied.

"Oh, well, I wouldn't cry for that," she returned. "Show that you can be a little man."

"I ain't crying for that," he retorted. "He ran into the house before I could get at him."—Philadelphia Press.

A policeman popped his head inside a crowded car.

"Excuse me, ladies and gentlemen," he said, "but there are two swell thieves in here."

"Dear me!" cried a nervous-looking individual. "I cannot risk my reputation in here."

Up jumped another gentleman with a gold watch chain and white waistcoat.

"I must get out at once," he said. "I have just taken some money out of the bank and I won't chance being robbed."

The policeman nudged the conductor.

"It's all right now, drive on; they've both got out."

The dominie was told by his family doctor that a glass of toddy would do him no harm. "I canna manage it," said the minister, "my housekeeper wad gossip among the church women."

"Oh, keep it in your private cupboard, and when you get your shaving water in the morning, get a little extra supply."

A month later one of the female parishioners who was calling on the housekeeper enquired as to the dominie's health.

"I'm sair afraid the meenister is losing his mind," was the answer.

"My goodness, how is that?" said the visitor.

"Weel, he asks for shaving water five or sax times a day."

A good story is being told concerning Sir Francis Hopwood, the Secretary of the Irish Convention, who has recently been made a peer.

It appears that he was once cross-examining a witness in an agrarian case in Ireland, and the man, describing how a tenant was evicted from his holdings by the bailiffs, remarked that the beam used to break down the door of the cabin was shaped like a battering-ram.

Sir Francis saw an opening—or he thought so, at all events.

"Have you ever seen a battering-ram?" he asked.

"I have," replied the witness stolidly.

"Where?" snapped Sir Francis.

"In London."

"Whereabouts in London?" persisted Sir Francis, with a smile of incredulity.

"In the South Kensington Museum."

TRAINING BRAINS FOR AFTER-WAR TRADE.

WAR is still with us, and may be for a while. With the echo of the first shot in the war there awoke in progressive business minds the thought of trade after the war. Not "Business as Usual" but "Business far Better than Before" is the slogan to follow. Leaders in business life are busy upon after-the-war problems to-day. Already the key-word to their thoughts is out.

That word is Education. Its effect is found in the decision of the Tootal Broadhurst Lee Co., Manchester, to appropriate $50,000 a year for five years for research to improve their products, and for education to improve the general efficiency of their employees. "Without improved education, and a closer link between science and industry, our future trade cannot expand as it should," says the Chairman of their Board of Directors. "In this respect we are behind some other countries."

So part time instruction in a works school during working hours is provided for, and employees who show outstanding ability are to be selected for further education. In special cases they may have whole time education and a university course to develop them. The purpose of the appropriation is to produce more specialized expert help for the company. Part of the fund is to be spent in research work by already available experts. The educational policy pursued is to bring out more experts.

The race for trade after the war will be closely contested. The countries best prepared by the education of the industrial and business brains that are to run their commercial concerns will come out winners. Financial as well as industrial training is demanded. Sir Richard Vassar Smith, in a recent address before the Institute of Bankers in London, said that recent developments of international banking meant a demand for young men with a knowledge of foreign languages, foreign exchange, and the commercial and financial conditions of other countries. Clearly a call for still further specialized education for the men who are to make a winner of trade after the war.

WHAT HATH THE YEAR BROUGHT US?

THE approaching close of the year bids many of us glance backward and in silent retrospect consider whence we have come and whither do we go. Each year has seen the prediction that the war would soon be over, and each year still sees it with us, influencing our thoughts, words and deeds to such an extent that, when it does reach a conclusion, the void left by the disappearance of such a mainspring of industrial activity will be immediately unfathomable.

Military events have influenced activities of the past year very greatly, for instance, the alternate depression and cheerfulness which have marked the fluctuations in munitions manufacture. That such happenings should take place is incidental to the nature of their origin, but that their effect on our private and national disposition should pass unnoticed is not right. It must be constantly kept in mind that the readjustments necessary during the transition period will have a much more acute influence on our individual lives than any temporary depression has had hitherto.

Viewing the turnings and twistings of Fortune's ship, and admitting however unwillingly that results are not what seemed likely to materialize at certain periods, we must take such comfort as we can from the saying that "things are never so bad but what they might be worse." There is a mean level to which all influences gravitate, some upward and some downward. Mankind is not gifted with such powers of intuition that basic principles can be ignored, and of these the law of action and reaction is not the least important.

As a nation, Canadians in Canada have suffered less than any other. That we can expect to see the business through and remain on Easy Street while the rest of the world is struggling in by-ways and vacant lots is absolutely foolish. Knowledge to plan, ability to execute and determination to support our share of the world's burden, willingly as well as uncomplainingly, are the essentials for our future guidance. It is a pleasing feature of the situation that financial interests realize the extent to which they will be strained in the period of readjustment—their ability to withstand it will determine more than anything else its duration and intensity.

The time for preparation is here—preparation for any eventuality, and the tentative evidences during the past year of all that readjustment will imply must receive more than ordinary consideration from those directly concerned with the industrial future of the country. If the year has done nothing else than bring to us all a sterner realization of the present and determination to face the future, it has not been unavailing.

INDUSTRIAL NOTABILITIES

HERBERT MARVEN EWAN, B.Sc., Vice-President, Taylor and Arnold, Ltd., Railway and Marine Supplies, Montreal; Vice-President, Central Engineering Co., Ltd., Montreal; Vice-President of American Flexible Bolt Co. of Canada, Montreal; Director of Canadian Brakeshoe Co., Ltd., Sherbrooke; Director, Boss Nut Co. of Canada, Ltd., Montreal, was born in Montreal, Oct. 19, 1876, son of Alexander and Kate Gourd (Bellhouse) Ewan, both of Scotland.

After receiving his education at Montreal Grammar School and McGill University, he began his career as assistant experimenter in tin plate manufacture, Bridgeport,

HERBERT MARVEN EWAN.

Connecticut, in 1899, leaving this in 1900 to serve a two year's apprenticeship in England with the firm of John H. Andrew and Co., Ltd., Sheffield. He subsequently returned to Montreal to take up sales work in the steel business, and after extended experience in this capacity became sales manager of Canadian Steel Foundries, 1913, and in the following year joined the firm with which he is now associated as Vice-President.

On May 23, 1907, Mr. Ewan married Blanche Gilmour, daughter of Duncan Gilmour, Sheffield, Eng., and has one daughter.

He is a member of numerous clubs, among them the Engineers'; Winter; St. George's Snowshoe; Royal St. Lawrence Yacht; University of Montreal, as well as the Royal Canadian Yacht and University Club of Toronto. His one society affiliation is A. F. and A. M. and he holds a commission as lieutenant in the Victoria Rifles. Tennis, yachting, fishing and skating are his favorite recreations.

Mr. Ewan is Conservative in politics and Protestant in religion and resides in The Linton Apartments, Montreal, Que.

Market Condition and Tendency

Trading Easier With Approach of Christmas—Steel for Private Work Scarce—Washington Price Revisions Awaited—Coke Shortage Continues.

BUSINESS generally this week has been upset on account of the elections but in other respects there is practically no change in the situation. Trading will likely be quiet for the remainder of the year as the Christmas holidays intervene. Merchants report quiet times in the iron and steel trade owing to the difficulty being experienced in obtaining supplies of steel for ordinary purposes which is restricting manufacturing operations. Consumers not engaged upon war orders are thus in an extremely difficult position, and the demand from such sources has fallen off. It is not very difficult to obtain steel for war work, but a considerable part of this is direct mill business and special arrangements exist for facilitating the procuring of supplies. Prices of steel products continue firm except for lighter gauges of black sheets which are easier; a slight decline in steel plates is expected in the near future. No announcements have been made following an important meeting in Washington to discuss the revision of prices on steel products. It is, however, believed that no change will be made from the prevailing schedule. The shortage of coke continues to restrict the production of pig-iron and the situation in the States is getting more acute. Furnaces in this district are also feeling the effects of the coke shortage. The non-ferrous metal markets are quiet, interest being centered on developments at Washington where an announcement is expected shortly concerning fixed prices on copper, lead and spelter.

MONTREAL, Que., Dec. 17, 1917.—Industrial activity continues unabated, although general business has been somewhat disorganized by the unusual interest being taken in the Federal House elections. The recent heavy snow and cold weather has added another to the difficulties under which manufacturers labor at the present time, as it has been almost impossible under certain conditions to secure delivery on much needed material. The recent calamity at Halifax resulted in the destruction of a large number of cars, a feature that has added to the acute condition of car shortage. Embargoes on exports from the States makes it increasingly difficult for manufacturers to obtain material and supplies from American centers.

Pig Iron

The situation in pig iron is unchanged although producers have been working under difficulties during the past week owing to inability to obtain raw materials, the recent storms and continued cold weather creating a serious factor for the furnaces. The situation, however, has shown a little improvement during the past few days but the shortage of iron is still more or less pronounced. In some quarters expectancy is shown that some revision will be made on the prices now ruling in the States.

Steel

No new developments have taken place

to alter the general tone of the steel situation. No definite announcement has apparently been given out regarding the decision arrived at during the recent meeting between the Government officials and the steel producers and manufacturers. While there is some possibility that prices may be readjusted in the near future, it is not likely that this will take place until well into the New Year, and even then it is not anticipated that such revisions will materially effect the present condition of the market, although some steps may be taken to relieve the pressure that is felt in certain directions.

The recent trend of events, however, has not been such as to remove the uncertainty that has characterized the situation for several weeks so that all buying is accomplished in a more or less cautious manner. This attitude is more pronounced in those steel products that are not in great demand for Government purposes. In addition to the increasing requirements for war necessities, the weather conditions during the past week or so have greatly hampered the transportation of all classes of materials so that production has suffered in many respects; this at a time when the recent closing of inland navigation has placed additional pressure on the various railroads.

Conditions are becoming so acute that unless consumers are working on Government contracts it is practically impossible to obtain steel and this tendency is daily becoming more pronounced. The freight congestion in the Eastern States has necessitated placing an embargo on all export material other than that specified for war purposes. The open market on billets and sheet bars is now virtually a thing of the past as producers are conserving their entire output for Government requirements. This condition also applies to structural material and domestic users of this class of steel have had to suspend operations until relief is assured. The urgent need for more cars and the stupendous program of shipbuilding is taxing the plate mills to their fullest capacity and this situation is likely to become worse before it is better. The same applies to almost every other line of steel product and Canadian conditions are reflected in those prevailing in the States. It has been reported that some difficulty is being experienced by those of our manufacturers who have secured American shell contracts, in obtaining the required steel from the States owing to the deferred action of the authorities at Washington.

The Canadian situation on the whole is unchanged and is likely to remain so until the turn of the New Year, as the elections here and the coming holiday season will have the result of disorganizing business to some extent. The heavy snow and cold of the past week has materially affected transportation facilities and manufacturers have suffered in consequence. Dealers report a very strong market with all price quotations very firm.

Metals

The general situation in the metal market is unchanged with tin still holding the center of interest. Conditions in the States are still hinging on the pending price fixing on some of the metals, definite action on which is expected at any time. The coming holiday season, however, has interfered with the progress of the work and the New Year may arrive before an anouncement is made. Copper is quiet, no early possibility of price revision being apparent. Tin is very strong but the acute condition of the past few weeks is less pronounced. Spelter is active under Government orders but the open market is very quiet. Lead is quiet but firm. Antimony is again weak and aluminum is in less demand.

Copper.—Steps have been taken during the past week towards coming to an understanding as to the price that will govern the sale of copper during the coming year or at least for such a period as may be agreed upon by producers and the Government. The announcement that some of the smaller producers find it very difficult to operate at a profit under the prices now ruling might indicate that any change would be in an upward direction. However, nothing definite has yet been done and it is still problematical just what conditions will prevail during the months of the coming year. Readjustments will probably depend upon developments, their nature at the present time being very uncertain. Local activity is light but prices are well maintained, dealers here are quoting 33 cents for lake and electro, and 32 cents for castings.

CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the War Purchasing Commission appointed by the Canadian Government: Hormidas Laporte, Montreal, chairman; George F. Galt, Winnipeg; William P. Gundy, Toronto. Thomas Hillier is secretary, and the Commission headquarters are at Ottawa.

Tin.—The market in tin continues to be the feature of the metal situation, and although the most recent reports point to a relief of the existing acute conditions, there is still a pronounced shortage of tin both here and in the States. While nothing has been made public as to the progress made by the American Government towards obtaining better shipments of tin from England or other points under the control of the British Government, consumers are beginning to feel the pinch as the available supply of spot tin is becoming noticeably less. Some consumers who were fortunate enough to have covered their requirements have been induced to dispose of small quantities of metal to other users to meet their immediate needs. Early prospects, however, seem to be towards an easier situation, but this can only be shown by future developments. The latest reports show a practical suspension of business on the New York market, with the latest quotation at the nominal figure of 86 cents per lb. Dealers here report active market with prices very firm, the current quotation being 78 cents per lb.

Spelter.—The general demand for spelter has shown no tendency to increase although the buying by galvanizers for Government sheet contracts has been recently quite heavy, manufacturers not being inclined to take any chance on the market for a lower price, rather showing a tendency to amply cover their requirements at present prices. The attitude of the American Government in connection with the fixing of spelter prices appears to be very uncertain and it is expected that this factor will be left for trade conditions to automatically adjust as the demand becomes more on a par with production. The New York quotation shows a weaker tendency, the quotation of 7¾ cents being a decline of ¼ cent on the week. Prices here are unchanged at 10½ cents per lb.

Lead.—The situation in lead has shown no tendency to develop special features and the market is at present unsettled owing to the uncertainty that prevails regarding the contemplated action of the American Government in the setting of price to regulate the sale of metal. While this was expected to have been announced before this it is not likely that definite action will be taken until after the holidays. Reports of pending business of considerable volume have given a stronger tone to the general situation. Lead is quoted at 9½c but with a weaker tendency.

Antimony.—Reaction has followed the recent slight activity in the antimony market and quotations have again declined; New York is quoting 15 cents, a decline of ½ cent over that quoted last week. The local quotation is firm and unchanged at 18 cents per lb.; the demand being fair.

Aluminum.—The market is not active and the demand is light, prices are unchanged but with an easier undertone. Dealers here are asking 60 cents per lb., but the market is weak with a lower undertone.

Machine Tools and Supplies

The machine tool industry is at present regulated by the requirements of the government, particularly in connection with the business in the States, a factor that to a large extent, may be said to prevail also in Canada, as manufacturers here are dependent to a large degree on the American market for their supplies in machine shop equipment. The restrictions that have been placed on the export of machinery from the States have, however, given increased impetus to tool builders here in Canada, as shown in the greater activity in certain lines. While the week has been fairly quiet, the volume of sales has been sufficient to maintain

an interest in the market. Political activity has somewhat disturbed the regular progress of events and it is not anticipated that any great business will be in evidence until the country has become settled and the holiday season is over. It is known that several industrial developments have been suspended until the election returns are announced. A return to normal conditions may follow the holiday season and in anticipation, many dealers are looking optimistically forward to it. Business in small supplies has shown a little falling off and this is accounted for by the disturbed condition of the country at the present time. No weakening tendency has developed in the prices quoted on small supplies and quotations are generally very firm.

Scrap

The market is generally quiet with an unsettled tendency owing to the nervous situation that prevails in the States. It is expected that some action will be taken early in the New Year towards the regulation of prices controlling the sale and distribution of old materials, a factor that will tend to put this market in a more stable relation to that of other markets. The local situation has shown an inclination to weaken on metal scrap but steel and iron scrap is firm with stronger quotations on steel axles and machine shop turnings. Scrap brass has declined one cent during the week; heavy quoted at 15 cents and light brass at 10 cents per lb. Heavy lead is now 5½ cents, a drop of ½ cent per lb. Aluminum is weaker, the quotation of 25 cents representing a decline on the week of 3 cents per lb. Scrap zinc has become a litle stronger, an advance of ½ cent raising the price asked to 5½ cents per lb. Steel axles are in good demand and quotations have advanced, although the ruling prices are on the sliding scale; a nominal quotation being $38 per ton. Machine shop turnings show an advance of 50 cents per ton, the current quotation being $9 per ton.

Toronto

TORONTO, Ont., Dec. 18.—Interest this week has centred almost entirely in the General Election, with the usual effect on business. Apart from this there have been no developments of importance. The favorable result of the election ensures a continuance of the "Carry-on-with-the-War" policy which will be to the benefit of the industrial situation in Canada.

The shortage of raw materials, particularly of steel, is assuming more serious proportions, and there is no relief in sight. A serious shortage of coal has recently been revealed in some parts of this province, while the natural gas supply has failed in Western Ontario, due to the severe weather prevailing. A number of factories have been practically closed down, causing a dislocation of business.

Steel

The shortage of iron and steel, which has already caused some restriction in manufacturing operations, shows no signs of improvement, and the outlook is not by any means satisfactory. Little difficulty is being experienced in obtaining steel for war purposes, but for ordinary manufacturing requirements consumers are not able to obtain material in sufficient quantities to satisfy their needs. The result is that business is dull, particularly for merchants.

Comparatively dull conditions will likely prevail for the balance of this year, and probably for the greater part of the first quarter of 1918. This applies to purely domestic business, and not to that section of the trade engaged upon war orders. Special arrangements exist for facilitating the production of war equipment and for obtaining all necessary materials for this purpose, but this is not the case for normal manufacturing activities. War requirements take precedence over all other work, which means that consumers not engaged upon war orders will have to be content to take what they can get. The mills are exceptionally busy now, but war needs have first call upon their output.

MARKET LETTER DEVELOPMENT

The attention of metal working plant executives is directed to the enlargement of the scope and usefulness of our Market Letter Department. In New York and Pittsburgh, expert correspondents have been engaged, and are already furnishing each week concise reports of production activities, price movements, etc., within the territory served by each of these important centres. During the next few weeks, further additions will be made to the number of our United States correspondents, embracing other industrial centres, and enlarging thereby the scope of the meantime service being rendered.

As far as can be judged at present no marked price recessions are likely to be made this year. The lighter gauges of black sheets are easier, having declined again, and a decline in boiler plate is expected shortly. Apart from these two products, there is no indication of an immediate fall in prices on steel products generally. The situation, however, in regard to prices is somewhat uncertain, and may to some extent depend upon developments at Washington. An important meeting was held in that city towards the end of last week, when, it is understood, the question of revising the fixed price schedule was discussed. No announcement has been made in regard to the result of the conference, but it is believed that the present schedule of steel prices will be reaffirmed by the Government.

President Wilson had previously fixed steel prices with the understanding that they would be subject to review after January 1. At last week's meeting the steel men pointed out that reductions in the present rates, which it is understood had been contemplated, would seriously impair the efficiency of the industry. It is considered almost certain that the Government will allow the present schedules to stand.

The unfilled tonnage statements of the U. S. Steel Corporation for November revealed a shrinkage of about 150,000 tons from the previous month, but it was the smallest decrease that has been shown for some time, and as there was no let up in shipments, it is a sign that the current business of steel companies is showing a big increase, with prospects good for an increase in unfilled tonnage for December. At present time the volume of steel business is showing some increase over what it has been at any time previously since price-fixing was first announced, with private consumers good buyers and a number of large Government contracts being placed.

Pig Iron

The shortage of coke continues to cause much anxiety to consumers, and as a result the pig iron situation is growing more serious. Production of pig iron in this district has not yet suffered much from the lack of coke, but will likely do so unless conditions improve materially in the near future. In the United States the shortage of pig iron, in view of the heavy demand, has reached an acute stage, and is steadily growing worse, with little hope of improvement in sight. Instead of meeting the growing demand, the furnaces have been barely able to keep the output from falling behind, the output not being sufficient to meet the consuming requirements of the trade.

Scrap

There is little to be said in regard to conditions in the market for scrap metals. Business is very quiet; in fact, there is hardly enough business passing to form a correct opinion of prices. The principal reason for the dull market is the contemplated price-fixing in the States. On this account consumers are staying out of the market pending a definite settlement of fixed prices.

Machine Tools

This has been a comparatively quiet week in the machine tool business, with no developments of particular importance. The demand is principally for tools for those munitions plants which are preparing to execute new orders for shells. It is becoming increasingly difficult to get equipment from the States, as a license has to be obtained before any machine can be shipped, and also the demand there is so heavy that deliveries now run into several months.

Supplies

Business continues steady, with firm prices ruling. Gasoline and coal oil are very firm, due to the advance in crude oil. Higher prices for coal oil are not unlikely. An advance in Pratt & Cady

stocks and dies is announced. One line, No. 1086, which formerly carried a discount of 22½ per cent., is now quoted at 10 per cent., while No. 1087, that formerly sold at 10 per cent. off, is now net list. No. 1085 stocks and dies are now quoted at list plus 30 per cent., the recent price being net list. A considerable advance has been made in the price of Barnes pipe cutters and Saunders pipe cutters, together with the parts therefor. Where Barnes pipe cutters were formerly quoted at 37½ per cent. off list, they are now quoted at 30 per cent. off list. Parts for Barnes pipe cutters are now quoted at 25 per cent. off list, the former discount being 32½ per cent. Saunders pipe cutters, that were formerly quoted at 27½ per cent. discount from list, are now quoted at 16 2/3 per cent. discount. Parts for Saunders pipe cutters are now quoted at a discount of 10 per cent. off list, the former discount being 22½ per cent. Linseed oil and turpentine have both declined. Linseed oil is now selling at range of $1.36 to $1.48 for raw and $1.39½ to $1.51 for boiled oil. Turpentine is now quoted at 71c to 74c per gallon.

Metals

Although prices for the most part continue firm and unchanged, the market is unsettled, due to conflicting reports from Washington concerning the situation in regard to prices of copper, lead and spelter. The price of copper was established some time ago, but there is an impression that it will be revised in an upward direction. An announcement regarding fixed prices for lead and spelter is expected any time, but there is no indication as to what the trend will be. The tin situation continues very unsatisfactory owing to the shortage and unusually high prices. The shortage of tin is serious, particularly for manufacturers of tin plate. Business in the local metal trade is steady and fairly active.

Copper.—Considerable uncertainty prevails in regard to the revision of copper prices, which are being considered at Washington. The general feeling seems to be that if any change is made at all it will be upward. It is generally believed that there will be sufficient copper to meet all demands, and the situation in this respect is satisfactory. Copper prices are unchanged, lake and electrolytic being quoted at 32c and castings at 31c per pound.

Tin.—The serious shortage of pig tin, evident for over a month, threatens to cut down the production of tin plate. This shortage has already been responsible for a sharp advance in price, and there is no indication of any improvement in the situation in the meantime. It is understood that the U. S. Government is taking steps to have the British regulations modified in respect to tin, so as to allow of adequate consignments being shipped to the States. Tin quotations locally are nominal and unchanged at 80c per pound.

Spelter.—The market is inclined to be easy pending the expected announcement from Washington, which may fix the price for prime Western and the higher grades. Local price is unchanged at 10½c per pound.

Lead.—The market is unsettled, being influenced by the price-fixing now under consideration at Washington. The impression prevails that if a Government price is established it will probably be below the current market. In the meantime lead is unchanged at 8½c per pound.

Antimony.—The market, which was active some days ago, is now quiet. Quotations are unchanged at 18c per pound.

Aluminum.—The market for aluminum is steady and unchanged at 62c per pound.

Washington

WASHINGTON, D.C., Dec. 15.—Chairman E. N. Hurley, of the United States Shipping Board, this week announced that the Board in co-operation with the Federal Bureau of Standards will undertake the construction of concrete cargo ships. This decision follows an investigation by the Bureau of Standards of a 4,500-ton concrete vessel now under construction at San Francisco. The Shipping Board and the Bureau of Standards will send special representatives to the San Francisco yard at once to gather information regarding the methods of construction. These will be used in later concrete construction by the Government.

Concrete Ship Construction

The Shipping Board has negotiated a provisional contract with Matthew Hale, of Boston, for the construction of twenty concrete ships of 3,500 tons each, by a Boston Company, to be called the Liberty Shipbuilding Corporation. The contract provides for a concrete vessel now under construction by the Boston concern being accepted by the Emergency Fleet Corporation. The Boston interests plan to construct their ships in a Southern yard, to be located either in South Carolina or Georgia. In presenting the proposal to the Shipping Board, Hale stated that the plans of his clients had been approved by marine experts of the Massachusetts Institute of Technology. The Shipping Board is further considering the construction of concrete barges to be used in the coastwise traffic.

Barge and Tug Construction

Chairman Hurley has announced that the Shipping Board has transferred $3,360,000 of its available funds to the War Department for the construction of twenty-four barges and four tugs to be used on the Mississippi river. These craft are essential, it was stated, in moving lumber and steel to the Gulf shipyards.

Merchant Service Control

Following weeks of discussion regarding control of the personnel of the merchant service, a compromise has been reached whereby the Shipping Board and the Navy Department will exercise joint control. The plan for joint jurisdiction was explained in an announcement, issued by the Shipping Board, as follows:

"The bulk of vessels under the American flag, whether engaged in the trans-Atlantic trade or elsewhere, so long as they retain their character as merchantmen, will continue to be manned by merchant sailors. Troopships and vessels carrying whole cargoes of munitions or supplies for the army and navy, however, for military reasons, will be manned by naval crews."

Acting on this plan the Shipping Board has adopted a comprehensive program for obtaining civilian crews that will be needed on the new fleets of the merchant marine. About 58,000 officers and men will be required for the ships the Board aims to put into commission before the end of 1918.

Explosive Plant Construction

Daniel C. Jackling, of San Francisco, managing director of a group of copper mines, has been designated by Secretary of War Baker to take charge of the building of the Government's explosive plants. Expenditure of more than $90,000,000 is contemplated in the erection of these plants to supplement the present output of the private munitions manufacturers.

Thomas A. Edison, with four other internationally known scientists, may soon be called upon to rule on the genuineness of what is claimed to be the greatest invention of mankind. The "Garabed" resolution, providing investigation of the purported discovery of Garabed T. K. Giragossian of a virgin natural force has passed the House of Representatives. If the Senate and President Wilson approve it, a committee of five eminent scientists to which the invention will be demonstrated will be appointed.

Closing hours of the debate on the resolution produced a strange scene. Opponents of Garabed, after interposing every known parliamentary obstruction, had brought into the House floor an electrical machine which they claimed paralleled the Garabed invention, but it was removed shortly after. Henry Perrigo, Kansas City, Mo., electrician, whose machine figured in the wrangle, stated he will attempt to induce Congress to subject his invention to the same committee of scientists which will pass on the "Garabed." Perrigo claims to be able to produce unlimited electricity from the air without the use of fuel. Garabed's claims are not based on electricity.

Under schedule 2531½, the Bureau of Supplies and Accounts, Navy Department, will open bids on December 28 for furnishing machine tools. On the same day, under schedule 2529½ the Bureau will open bids for furnishing 64 motor generators and 29 dynamo motors to various navy yards.

A quantity of pipe, nuts, rivets, hoes, etc., are required by the Panama Canal Commission, bids for which will be opened December 28, under Circular 1189, which can be obtained from General Purchasing Agent, this city.

The Alaskan Engineering Commission is inviting bids until December 27 for

THE A. R. WILLIAMS MACHINERY COMPANY, LIMITED
W. Front St. *"If it's Machinery Write Williams"* Toronto

Stationary Plants **Portable Plants**

WELDING

We can make satisfactory repairs on any broken Metal, Steel, Cast Iron, Wrought Iron, Malleable Iron, Brass, Bronze, Copper, Aluminum, etc., by Autogeneous Welding.

CUTTING

We can Cut Steel or Plate to any desired forms or into Scrap, at reasonable figures with the oxy-acetylene process.

LEAD BURNING

We employ a staff of expert Lead Burners.

WELDING EQUIPMENT

We manufacture and carry in stock complete welding and cutting outfits together with all the supplies necessary for operation.

Canadian Welding Works Ltd.,
51 Montfort Street, Montreal

Manufacturers of Steel Tanks, Shell Nosing Fronts, Welded Window Frames, and Welding Equipment

---

Cost Reducers for Shell Makers

SPECIAL PURPOSE SHELL TOOLS

Designed for use in our own Factory and found so satisfactory that other Shell Factories have asked for and been supplied with them:

Boring Lathes
Base Boring Lathes
Waving Lathes
Band Turning Lathes
Hydraulic Band Presses
Shell Grinding Machines
Shell Cleaning Machines
Undercutting Machines
Finish Tapping Machines
Inside Profiling Machines
Nicking Machines
Centering Machines

We can supply any of the above complete, ready for use, **at about half the cost of ordinary tools for the same purpose**, or we can furnish you with **a complete set of castings** ready for you to machine and set up.

We have sold these to many Shell Factories in Canada, and have had many testimonials regarding their good qualities and economy in use.

Marsh & Henthorn, Limited
Belleville - - Ontario

furnishing a quantity of machinery. Details can be secured from C. E. Dole, general purchasing agent, Seattle, Wash.

Admiral F. R. Harris, chief Bureau of Yards and Docks, Navy Department, is soliciting bids until Jan. 7, for furnishing one 40-ton and two 10-ton electric overhead traveling cranes.

New York

NEW YORK, Dec. 15.—Government munition orders are still being placed with a liberal hand, and other war contracts are in readiness as soon as the factories have been adjusted to take them. Freight congestion, railroad embargoes, snowstorms and zero weather, while curtailing plant operations in New England, have failed to check the ardor of manufacturers, who are giving almost their entire time to assisting the Government to produce guns, shell and air craft for the army and navy. There is scarcely a New England factory that has not received an order of some kind from the Watertown Arsenal covering gun parts and mechanisms and tools to equip the new extensions at Watertown.

At Bridgeport the Liberty Ordnance Co. is preparing to greatly increase its output of 5-inch naval guns, and the Remington Arms U. M. C. Co. is increasing production of rifles and cartridges. The Colt's Patent Fire Arms Mfg. Co., Hartford, Conn., is rapidly equipping its plant at Meriden, which was recently acquired. Half of the Mayo radiator plant at New Haven, belonging to the Marlin Arms Co., is being converted for the manufacture of rapid fire machine guns, and it is also increasing the output of its Norwich plant. The Sterling Motor Co., Brockton, Mass., is building an addition in order to be in position to execute new contracts for shell and for gun sights, recently received from the Government.

Airplane Plant Organization

Furniture manufacturers of Grand Rapids, Mich., at the behest of the Government have mobilized their plants for the manufacture of airplanes and have organized the Grand Rapids Airplane Co. with a capital stock of $200,000, through which individual manufacturers will receive their orders from the Government. Automobile plants at Lansing, Mich., are preparing their factories to turn out war munitions. The Reo Motor Co. is making changes in its shop equipment for the manufacture of shrapnel cases. The Lincoln Motor Co., of Detroit, who recently purchased $2,500,000 worth of machine tools to manufacture Liberty airplane motors, expects to have the new plant, now under construction, ready for operation by the middle of February. Dodge Bros., Detroit, who have been awarded a large contract for recoil gun devices by the Government, expect to have their new plant ready in the spring, and fifty of the tools recently commandeered by the Government in New York have been ordered shipped to Detroit.

Fewer large contracts for machinery were placed in the New York market in the past week, but there is still an active demand for small lots of tools needed by plants on the seaboard as well as in the interior. The American Can Co., which has an order for four million 75 mm. shell from the Government, is preparing to purchase 150 tools for the equipment of its Edgewater, N.J., plant. This company is also going to increase its plant at Jersey City. The Standard Ordnance Corporation, which is to build 155 mm. gun carriages at Hamilton, Ohio, has made additional purchases of tools in the New York market. The United States Government is still in the market for cranes for installation in the new shops at the Washington Navy Yard and for equipping the Sandy Hook Proving Ground.

Steel Output Will Meet Requirements

At the Washington conference last Monday between the War Industries Board and representatives of the Iron & Steel Institute it is understood that assurance was given by the producers that while the output of steel is being cut down by coke shortage and freight congestion, an ample supply of all products will be available to meet war requirements of the United States Government and its Allies. The question of price revision to be made after the 1st of January was only referred to incidentally, but some consideration was given to prices at the meeting held yesterday.

The Iron & Steel Institute is preparing a pamphlet giving in detail the base and differential prices with tables of "extras" established by agreement between the Government and the manufacturers, which, by request of the War Board, will be issued to the trade as the official guide. It is known that some members of the Federal Trade Commission are in favor of revising prices in the near future, but this sentiment is not accepted by the War Industries Board. and the steel manufacturers and distributors are strongly opposed to any changes until time has been given to test the schedules already adopted.

Pittsburgh

PITTSBURGH, Pa., Dec. 15.—The steel market has turned still quieter in the past week. There is an effort made by some authorities in the trade to ascribe the quieter conditions of the past fortnight to the resuscitation at Washington of the price question. At the same time they profess to feel assured that the Washington authorities are not going to make any serious effort to have prices revised downward, and no one contends that there is any hope of the producers having them revised upwards. It seems more natural to attribute the quietness of trade to the season of the year and the fact that the country is getting still more on a war basis.

Last Monday's conference between the War Industries Board and the iron and steel makers was devoted chiefly to consideration of revised methods for apportioning war steel tonnage and placing the actual orders. Prices, it is said, were mentioned only casually. The programme is that following yesterday's conference between the Federal Trade Commission and representatives of the steel industry the Commission will submit to the War Industries Board some of the cost data it has been accumulating in the past six months, whereupon the board will call another meeting with the steel industry prior to Jan. 1. As the various set prices were definitely announced to run to that date, it is necessary to take some formal action, if only to pronounce them good for a further period or for an indefinite time.

Operating Difficulties

A cold snap, with zero weather, descended upon the whole central west immediately after last report was written, and in the past week all operations in the iron and steel industry have been materially reduced. There has been a fresh shortage of coal at many steel plants and the shortage of coke at blast furnaces has been accentuated. There have also been difficulties with frozen ore, frozen pipes and other obstacles to full production.

While much is made in trade circles of the decreased production arising from weather and transportation difficulties, it is important to observe that the steel makers have given the Government authorities fresh assurances that all the war steel required will be furnished on time, while on the other hand ordinary buyers do not seem to be incommoded seriously by insufficient deliveries of steel. If they are not receiving as much as they could use under normal conditions, their own operations have likewise been interfered with by much the same influences that have operated in the steel industry.

Production Varies

The rate of production shows wide variations in different lines. Steel is diverted to the finishing departments, whose product is most needed. Sheet bar supplies to tin mills are almost normal, while to sheet mills they are greatly reduced. In the past week the tin mills have operated at between 90 and 95 per cent. of capacity, the sheet mills at only about 50 per cent. Production of shell steel and plates seems to have been well maintained, while production of standard steel pipe and wire has suffered greatly. All the American Steel & Wire Co. plants at Cleveland were down at the beginning of the week, chiefly from lack of coal.

Pig Iron

It continues to be the case that there is practically no pig iron offered in the market for early deliveries. There is no basic or Bessemer at all, and foundry iron can only be bought, if at all, by regular customers of the furnaces. There is, however, some foundry iron business being done for second quarter and second half of next year. The requirements of foundries are much lighter than formerly, but there is correspondingly light production, so many furnaces being operated on basic iron. Quotations when made are always at the set prices, $33 for basic or No. 2 foundry, $36.30

PITTSBURGH MARKETS

(Continued from page 60.)

for Bessemer, $33.50 for malleable, and $32 for forge, f.o.b. furnace.

Discard Steel Offered

Nothing but odd lots of ordinary soft steel billets are offered, and then only occasionally. There are, however, free offerings of discard steel, arising from the manufacture of shell steel, and this steel does not find sale equal to the offerings by any means. Some of the mills will roll the steel to specification, down to 1½-inch, and the highest price they usually ask is the set price for soft steel of corresponding size:—Billets, $47.50; small billets, $51; slabs, $50; Pittsburgh or Youngstown. No tonnage figures are available as to shell steel, but it is evident that the production has been increasing very considerably.

Prospects of Supplies

While the market situation presents the appearance of strength, with deliveries in practically all lines rather difficult to secure, except upon old contracts, there is little doubt but that with anything like full production of the basic materials, pig iron and crude steel, there would be fairly plentiful supplies of finished steel in certain forms, those not largely required for prosecuting war. The finished steel industry has only a certain amount of flexibility, the total finishing capacity only slightly exceeding the total capacity for producing raw steel.

With the production of raw steel curtailed, the output can be allotted in accordance with the needs for finished products, the mills making the products most in demand being operated as fully as possible while the mills whose product is not so much needed receive correspondingly less steel. If the production of steel were at capacity, instead of in the neighborhood of 85 per cent. of capacity, the steel could be finished only by diverting more of it to the departments now operating at far below their capacity, and such finished products would then be found to be relatively plentiful. The question is whether the blast furnaces and steel-making departments can operate at capacity at any time this winter.

Iron and steel exports in October amounted to 571,893 gross tons, against 489,415 tons in September, and a monthly average of 543,000 tons in the 12 months November, 1916, to October, 1917, inclusive, approximately the twelvemonth period of heaviest exports. While some exports have been embargoed, and the shipping situation is unsatisfactory, it is evident that shipments of war material are going to be so forced as to maintain a good total tonnage of exports right along.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

ENGINEERING

Valleyfield, Que.—The power house at the Montreal Cottons, Ltd., plant was destroyed by fire on Dec. 13.

Brantford, Ont.—The Steel Company of Canada propose building an addition to their plant here at a cost of $100,000.

Beamsville, Ont.—Work will commence shortly on the construction of hangars and other buildings for the proposed aviation plant which will be located here.

Toronto, Ont.—A building permit has been issued to The Canadian Aeroplanes, Ltd., for an additional storey to a building on Dupont Street, to cost $27,000.

Winnipeg, Man.—The Transcona Shell Co., which has been operating the G.T.P. shops at Transcona will it is understood establish a plant for making munitions at Batavia, N.Y.

Toronto, Ont.—The city architect has granted a permit to the Canadian Fairbanks-Morse Co. to erect a one-storey munition shop adjacent to their present plant on Bloor Street. The estimated cost is $5,000.

Ladysmith, B.C. — The Ladysmith smelter was blown in again on Dec. 3, for at least a few weeks run. It is hoped that before the present supply of ore is exhausted that there will be enough additional supplies in sight to warrant the management continuing the run for an extended time.

Wallaceburg, Ont.—Damage to the extent of $100,000 was done on Dec. 11 by fire to the Wallaceburg plant of the Dominion Sugar Co. The fire followed an explosion believed caused by an explosion of gas used for reheating the dryers in the pulp building. The blaze completely destroyed the building and machinery and 7,000 bags of pulp.

Vancouver, B.C.—A permit has been granted to the Schaake Engineering Co. for the first unit of engineering works to be erected shortly. The first unit will comprise a machine shop that will cost $46,750 for the building alone. The firm will be able to handle almost any class of repair work, as well as build machinery of all kinds.

Sault Ste. Marie, Ont.—The Algoma Steel Corporation will make considerable additions and improvements to its plant, including the installation of 25 by-product coke ovens, with by-product equipment. Construction will be started immediately, and it is expected that the plant will be completed by the middle of 1918. The contract for the installation of the coke ovens has been awarded to the Wilputte Coke Oven Corporation, New York.

Niagara Falls, Ont.—A 13-foot wood-stave pipe line will be laid from the river to Queen Victoria Park down to the development at the foot of the Falls. This pipe line will enable the Ontario Power plant to be developed to its full capacity, and will produce an extra 25,000 horse-power. The new pipe line will provide enough water for additional generators as well, and to utilize it tenders will be let for the installation of additional turbines, with penstock and generator complete. This will give another 20,000 horse-power available ten months from now.

Montreal, Que.—An influential syndicate has been formed to finance and operate a new glass company in a suburb of Montreal called St. Pierre, to be known as the Consumers' Glass Co., and to work in opposition to the Dominion Glass Co., which has several plants throughout the country, including factories at Toronto, Hamilton and Wallaceburg. The new company is taking over the plant of a company formerly called the Premier Glass Co., which previously had taken over the plant of the Atlas Glass Co., and both of which proved failures.

ELECTRICAL

Kingston, Ont.—On Thursday afternoon engineers Kribs and Johnson of Toronto turned on the Hydro-Electric power from the Trent at the Kingston sub-station, and everything worked satisfactorily.

GENERAL

St. Johns, Que.—A serious fire, supposed to have started in the boiler room of the Excelsior Straw Works, last Thursday destroyed the Excelsior Straw Works, St. Johns Straw Works, Thuote Moving Picture Theatre, and several other buildings. The total loss is about $125,000, partly covered by insurance.

Toronto, Ont. — The newly-erected manufacturers' building of W. T. Dillon and Company, 183 George Street, was the scene of a fire on Dec. 10, that damaged the building and contents about $7,000. The chief sufferer was the John Crane Co. Their loss is estimated at about $5,000, of which about $1,500 is to machinery. The damage to the building is placed at $1,500.

MUNICIPAL

Galt, Ont.—A by-law will be submitted to the ratepayers on Jan. 1 to provide money for extensions to the waterworks system to cost $18,558.

Alliston, Ont.—A by-law will be voted on by the ratepayers on Jan. 7 to authorize an expenditure of $6,000 for electrifying the municipal pumping plant.

Toronto, Ont. — The Harbor Commissioners have referred to the board's engi-

neer and to Fire Chief Smith the proposal that a fire boat be purchased for protecting the water front and island.

Toronto, Ont.—Fire Chief Smith has recommended the purchase of two motor fire trucks, to cost $24,000, to protect the district surrounded by Liberty Street, Dufferin Street, Hanna Avenue and the G.T.R. tracks. Works Commissioner Harris reports that new high-pressure mains in the district would cost $20,000.

Windsor, Ont.—The Water Commissioners have decided to instal at once two motor-driven pumps to obviate danger which threatened to arise as a result of the fuel shortage. It is proposed to use Hydro power to drive the pumps and to keep the present steam installation for auxiliary purposes. However, in order to relieve the load upon the Hydro system in the early evening the steam pumps will be used for an hour or two.

Chatham, Ont. — A serious situation has developed in Western Ontario on account of a shortage in supply of natural gas. The gas pressure failed in Chatham last Saturday, the available supply being hardly sufficient to keep water from freezing in the boilers. There is also very little coal in the city and a number of factories may have to close down. Unless there is a change in the temperature very little relief can be expected.

Hamilton, Ont.—At a special meeting of the Barton Township Council held last Saturday, it was proposed to enact a by-law for the purpose of raising $55,000 for the purpose of installing a Hydro system in the township. It will require $22,000 as a first investment to buy out the present system, the rest of the funds to be held for extensions, etc. The question will be placed before the electors of the township when they ballot for the municipal elections.

North Vancouver.—The district of North Vancouver council on Nov. 29 passed a resolution authorizing the clerk to prepare a general loan by-law to provide the sum of $35,000 for waterworks purposes. The money, which in the event of this by-law passing at the general elections in January, is intended for the establishment of a waterworks system east of Seymour river. The principal need for such a system is to provide a steady and sure supply to the two large industries at Roche Point—the Canadian Robert Dollar Co. and the Vancouver Cedar Mills, Ltd.

CONTRACTS

Hamilton, Ont.—The Board of Control has awarded a contract to the City Brass Co., Hamilton, for the year's supply of brass at $2,465.

Toronto, Ont.—The Board of Education has awarded the contracts for the Alexandra school annex. The tenders amounted to $102,081 whereas only $70,000 was provided for this work in the estimates. The successful tenderers were as follows: Masonry, $38,500, Witchall & Sons; carpentry, $22,171, Frank Armstrong; heating and plumbing, $21,998, Purdy, Mansell; iron work, $3,675, Can. Wire & Iron Co.; plastering, $4,950, Geo. White; painting, $2,525, Jas. Casey; concrete, $2,147, Concrete Construction Co.; flooring, $1,345, Can. Glass, Mantel & Tile Co.; galvanizing, $1,345; heat regulators, $1,183, Johnston Temperature Co.; electrical work, $897, Can. Electric; roofing, $1,345, J. F. Flowers.

TRADE GOSSIP

New Tonnage Equals Losses.—British tonnage completed in the month of November was within measurable distance of the tonnage losses in that period by enemy attacks, it was announced in the House of Commons on Dec. 11, by Sir Leo Money, Parliamentary private secretary to the Ministry of Munitions.

Contracts Adwarded for 4,000 New Ships.—Contracts have been let by the United States Federal Shipping Board for 4,000 ships with net dead-weight carrying capacity of eight million tons. Raymond B. Stevens, vice-chairman of the board, told the members of the Academy of Political Science at the opening of their thirty-seventh annual meeting at New York on Friday that he thought at least six million tons would be available next year.

Buy Machinery for China in U. S.—A party of eight Chinese has arrived in New York to arrange for the purchase of a large quantity of machinery for shipment to China. The report has gone out that the purchase was to be of agricultural implements and machinery, but Mr. Ying said this was not so. Mr. Ying emphasized the fact that they had been appointed by the Chinese Government to handle the machinery purchase, and they would have nothing to do with any other matter while in America.

U.S. Steel Output.—Considering all the difficulties against which the steel companies have been obliged to contend, production in November was satisfactory, being slightly larger than in September or in July. The average monthly output of steel since July 1 by the Steel Corporation has been approximately 1,640,000 tons. The production of rolled products in November is indicated to have been a little under 1,200,000 tons, and the average monthly output since July 1 is 1,235,000 tons.

War Expenditure for November.—Canada's war expenditure during the month of November totalled $18,714,472, making a grand total of war expenditure to November 30 of $151,969,271. The total net debt on November 30 was $958,000,700. as compared with $706,128,082 on November 30. 1916. Revenue for the month on consolidated fund account was $24,322,946. and expenditure for the month $12,922,635. Revenue for the eight months period to November 30 was $170,042,006 and expenditure $79,566 862.

James Carruthers Gives Aeroplanes.—According to the *Westminster Gazette*, London, James Carruthers, of Montreal,

Scandinavia Belting

You will wonder at its great pulling strength; as year after year goes by, at its all-'round enduring goodness. Edges treated to resist shifters, this — the original solid woven cotton belt—costs you less in the first place and ever after. Used in most places that leather is used.

Put a stop to your belting trouble. Send for our monthly Belting Book TO-DAY. Free.

ex-President of the Montreal Board of Trade and President of the Canada Steamship Lines, has offered to the British Government, through Lieutenant-Colonel W. Grant Morden, the gift of four battleplanes for use on the Western front, and the Air Board, in accepting the gift, has expressed its warm appreciation of so generous a contribution. Mr. Carruthers has already presented three aeroplanes to the Canadian authorities, and has given upwards of a quarter of a million dollars to Canadian patriotic funds.

Bill to Get Rid of German Control. — The non-ferrous metal bill, which gives the British Government control of all dealings in metals not containing iron and is intended to destroy what hitherto had been a virtual German monopoly in these metals, was passed on the second reading by the House of Commons, London, England, on Dec. 9. In the course of the debate Andrew Bonar Law, Chancellor of the Exchequer, said he wished to let Germany know that Great Britain realized her power commercially, and that when the time came she should use it. Germany should also remember, he said, that the longer the war lasted, the less raw material there would be to go round and the allies would help themselves first.

To Build Training Ship.—The Danish-Canadian Patriotic Fund of Toronto has launched a campaign for a subscription of $100,000, which is to pay for the building and rigging of a school-ship for the training of young lads in practical seamanship. It is the intention of the organization to build other ships for the same purpose. These will be stationed at such points as St. John, Quebec, Montreal, Winnipeg, Vancouver, etc. The "Denmark," as the first ship will be called, is to be presented to the Canadian Navy League, and will be stationed at Toronto. It will be considered the flagship of the fleet. All money orders and cheques should be made payable to the Danish-Canadian Patriotic Fund and sent to the Wesley Building, Toronto.

Canada Large Buyer of U.S. Tin Plate.—According to the United States Department of Commerce imports of pig tin and palm oil, both essential in the manufacture of tin plate, show an increase for the ten months ended October 31, 1917, over the corresponding period for 1916, while exports of domestic tin plate and terne plates show a falling off. Imports of palm oil amounted to 33,703,671 pounds, against 24,976,235 pounds in 1916, and imports of pig tin were 126,125,792 pounds as compared with 121,048,537 pounds for the first ten months of 1916. Exports of tin plate up to October 31, 1917, totalled 421,137,657 pounds, compared with 433,000,173 pounds in 1916. Argentina and Canada were the largest customers for American tin plate, the former country leading for the first time in this respect.

New Car Ferry Being Built at Levis. —The new ferry now building at the yards of the Davie Shipbuilding and Repairing Co., Levis, Que., will have a speed of 14 miles an hour and will have a hold capacity of 70,000 cubic feet. It is designed to carry 20 cars, will be 308 feet in length over all and of 52 feet breadth, with a depth of 20 feet 6 inches. The gross tonnage is estimated at 5,000 tons and the net at 3,000 tons. The engines installed will be one four-cylinder triple, 2,200 i.h.p., and the boilers installed will be four of the Scottish marine type, 11½ feet in diameter, 175 pounds working pressure, having 5,500 square feet of heating surface and 143 feet of grate area. The capacity of No. 1 hold will be 40,000 cubic feet, and of No. 2 hold 30,000 feet. The area of the main deck will be 13,000 square feet.

Power Canal Making Progress.—Excellent progress is now being made on the Chippawa Hydro-electric Power Canal and the preliminary work has got well under way. The construction railway which will carry away the material excavated has been completed from the Whirlpool to the power-house, and the rest of the line is being pushed forward. The Hydro engineers were handicapped by shortage of labor, but now about 350 men are employed. At the present time operations are being centred on the erection of a concrete bridge for the Niagara, St. Catharines & Toronto Railway tracks at Stamford, Ont. This is only one of about thirty bridges which will have to be built. The engineers are filling in a great many ravines around the Niagara River with the earth taken out in excavating the canal.

Japan Needs Chemicals.—The ban on cotton and restriction on steel have caused much anxiety throughout Japan, but now chemical importers are at the fore protesting against the shutting off of their supplies of caustic soda, glycerine, and soda ash, all of which are largely obtained from the United States. These three articles are much wanted in Japan. Soda ash is required for glass manufacture, and, to the end of August of this year, was imported to the value of $1,696,484. Much more than 50 per cent. of this came from the United States. England has now prohibited export of any of these chemicals. Attempts have been made to manufacture soda ash in Japan, but they are still in the experimental stage. Glycerine is produced in Japan by a few concerns, but their combined output is entirely inadequate.

G.T.R.'s Annual Track Inspection Completed.—The annual inspection of track over the Grand Trunk Railway System has just been completed. This inspection has occupied six weeks, and has included a thorough examination of rails, ties, etc., on the 1,145 miles of main line, and on some thousands of miles of branch lines. The inspection party travelled over the system in a specially constructed car fitted with electrically controlled devices for registering the efficiency marks gained by the various sections for excellency of track maintenance. There was the keenest competition between the various section gangs, foremen and supervisors for the honors which are given to the section considered to represent the highest standard of maintenance work. These inspection trips serve to increase the enthusiasm of the men engaged in this important branch of railroad work, and enable the officers to give the closest supervision to the maintenance of the track in a high state of efficiency.

PERSONAL

Herbert Johnston has been appointed Canadian sales manager of the Armstrong Whitworth Co. of Canada, Montreal, not city sales manager as was stated in last week's issue.

Captain Arthur C. May, one of the best-known vessel masters on the Great Lakes, died at his home in Port Huron, Mich., on Dec. 11, after an illness of five months. He was 58 years old, and resided in Port Huron 28 years.

G. H. Smith, vice-president of the International Petroleum Co., Toronto, has been elected president in succession to Walter C. Teagle, now president of the Standard Oil Co., of New Jersey.

Lt. J. K. L. Ross, of the R.N.C.V.R., has been promoted to the rank of commander for the splendid services he has rendered to the Department of the Naval Service and for his generosity in many other ways.

William Clark Hawkins, managing director of the Dominion Power and Transmission Co., of Hamilton, Ont., has been elected president of the Southern Canada Power Co., of which he was already a director. Mr. Hawkins was born at Orange, N.J., in 1866. He became associated with the D. P. & T. Co. in 1901 and was appointed managing director in 1912.

Lieut. George H. Forster, who, before going overseas was manager of the Linde Canadian Refrigeration Co., Montreal, has been badly gassed in the recent fighting while serving with the British army. Although his condition is serious, there is hope of his recovery. Lieut. Forster joined the 148th McGill Battalion, under the command of Lieut.-Col. Magee, and left in 1916 for England, but later was transferred to the Imperial Forces.

Lieut. Commander J. A. M. Murray, one of the C.P.R. fleet captains, was instantly killed in the explosion at Halifax. Capt. Murray was for about 15 years in the Elder-Dempster West African trade, and also in the West India line. When the C.P.R. took over the Elder-Dempster line, Captain Murray went with the ships and served under the C.P.R. until four years ago, when he became Harbor Master of Quebec. When the war broke out, he was sent by the Canadian Government in the winter to Halifax. Later he was at Sydney, and last summer returned to Halifax, where he was put in the Imperial service. He was in command of the Lake Manitoba for a long time before taking the command of the Empress of Britain.

RAILWAYS & BRIDGES

Port Arthur, Ont.—Fire starting in the basement of the C.N.R. station building on Dec. 12 did material damage to the extent of about $15,000.

TENDERS

Toronto, Ont.—Tenders are now being called for the building of Child's Restaurant at the corner of Yonge and Dundas Sts., on the site of the old Vendome Hotel, to cost $100,000. It will be of structural steel, blue stone and granite construction.

BUILDING

Ottawa, Ont.—About a month's time will be required for the restoration of Pier Two, the reception hospital and clearing depot at Halifax, which were badly damaged by the Mont Blanc explosion.

MARINE

Port Colborne, Ont.—Storm warnings have been discontinued here for the season.

Port Colborne, Ont.—The Welland Canal was officially closed for the season, December 15th.

Vancouver, B.C.—Following upon the announcement that John Coughlan & Sons had been awarded contracts by the Imperial Munitions Board for the construction of four steel steamers at an approximate cost of $7,000,000, comes information that the Coughlin plant will be greatly extended at a cost of approximately $250,000. At present there are 1,000 men at work on the six steel steamers. It is proposed by the firm to employ at least 2,000 men.

CATALOGUES

Dwight Co. Indicator.—Bulletin "C" illustrating and describing the Dwight Co. indicator made by the Dwight Mfg. Co., Chicago. Copies of the bulletin may be obtained from the Allen General Supplies, Ltd., Toronto, who are the Canadian agents for this instrument.

Atlas Babbitts-Catalogue issued by the Atlas Metal & Alloys Co. of Canada, Ltd., Montreal. The catalogue describes an extensive line of "Atlas" babbitt metals and other alloys for all kinds of bearings. Details of a friction test of "Atlas" metals and a long list of steamships is given in which "Tenaxas" metal has been employed in the main engine bearings.

Tool Grinding is the title of an interesting booklet just issued by the Norton Company, Worcester, Mass., containing a great deal of useful information on tool room grinding. The booklet explains the correct way to grind cutters of all kinds, reamers, drills, lathes, planer tools, and dies. A number of grinding operations are illustrated to assist the reader in following the text.

In Safety First and always.
In providing for the Health of my Fellow Workmen.
In Light and Air and sanitary Working Conditions.
In clean, fresh drinking water for everybody.
In the Safety, Economy and Man-betterment.

PURO SANITARY DRINKING FOUNTAIN
(MADE IN CANADA)

The loss of a man through impure drinking water is a crime that "the front office" must bear.
An ugly statement, isn't it? But true, absolutely.
When a man comes to work in your factory he puts his health in your keeping.
Are you willing to take chances on such a trust?
Impure drinking conditions are responsible for more tragedies than any machine ever built.
Apply the "Safety First" Principles to your water supply; don't deny your men a clean, fresh drink of water.
Conserve their health and they will improve your profits; make yourself as worthy of the name of "employer."
Install the Gold Medal winner Puro in your plant, office and shop alike.
The only Sanitary Drinking Fountain that is safe, sanitary, simple, automatic in control and easily attached.
Let us tell you just what it will cost you to

Pneumatic Tools.—Kellar Pneumatic Tool Co., Fond du Lac, Wis., have issued three pamphlets dealing with a line of chipping and riveting hammers and a sand rammer. In the first two the construction of the hammers is explained in some detail, with illustrations of the various styles that can be supplied and their component parts. In the last bulletin the advantages of pneumatic ramming in foundries and for other work is touched upon with illustrations of the different types available.

Tool Room Specialties.—Taft-Peirce Mfg. Co., Woonsocket, R.I., have distributed a catalogue describing a line of tool room specialties, which includes bench plates, boring equipment, gages of all kinds, knees, parallels, sine bars and v-blocks. Each specialty is given a single loose leaf with an illustration, brief description and in some cases tables of the various sizes that can be supplied. A feature of the catalogue is its paging according to the style numbers of the various articles covered. Mention is also made of the work which the company is prepared to do in the design and manufacture of special gauges, fixtures or tools.

TENDERS WANTED FOR TELEGRAPH EQUIPMENT

THE Canadian Trade Commissioner in Cape Town, W. J. Egan, has forwarded to the Department of Trade and Commerce copies of indent No. 151, issued by the Department of Posts and Telegraphs of the Union of South Africa and recently transmitted to the High Commissioner for South Africa in London. Interested manufacturers will note that this indent is not to be executed until after the termination of the war. The requirements represented in the indent include such items as galvanometers, single and double-current keys, circular carbon protectors, wheatstone receivers, relays, sounder screens, wheatstone transmitters, magneto bells, terminal blocks, terminal boxes, pay station telephone apparatus, repeating coils, distributing frames, lightning protectors, protectors with carbons and fuses, jacks, receivers, switches, switchboards, frames, cross-connecting fields, battery boxes, protector strips, test plugs, telephone (magneto wall, central battery wall, central battery table), telephonemeters, telurs, test sets, galvanized iron arms, galvanized bolts, brackets, cement, clamps, clips, connectors, insulators, spindles, cupholders, washers, manhole covers, milonite nails, cast-iron pipes, copper plates, sheet iron plates, plumbers' metal, iron tapered telegraph poles, screw rings, lightning rods, parallel poles, cable suspension rings, salamac, lead sleeves, paper sleeves, solder resin, tinman's solder, stay rods, pole steps, tape, copper tapes and binders, copper wire, galvanized iron wire, barbed wire, steel suspension wire, vulcanized india-rubber wire, braided indoor wire, bridle wire, flameproof wire, aerial vulcanized india-rubber cable, underground telephone cable, armoured telephone cable, silk and cotton telephone cable, switchboard cable, aerial telephone cable. These requirements should be of service in pointing out to Canadian manufacturers the necessity of representation in South Africa or London. This indent may be seen at the Department of Trade and Commerce. (Refer File No. 18760.)

TRADE ENQUIRIES

THE following trade enquiries have been received by the Department of Trade and Commerce, Ottawa. Further particulars may be obtained on application.

1506. **Pig-iron, steel plates for shipbuilding, marine oil engines, etc.**—A Genoese firm who are contractors to the Royal Italian Government, and to the leading shipyards, engineering companies, and shipowners in Italy, are prepared to open negotiations, for after-the-war trade, with Canadian concerns who manufacture the following: Pig-iron, metals, steel plates and sections for shipbuilding, auxiliary machinery, marine oil engines and other materials used directly or indirectly in the shipbuilding and engineering trades.

1507. **Electrical equipment.**—An importing house in Genoa, Italy, which is thoroughly conversant with the electrical needs of the Italian market, wishes to correspond immediately with Canadian manufacturers of electric motors, transformers, dynamos, turbines, and electrical cable.

1511. **Machinery and metals.**—An important firm of merchants and representatives in Italy, with head offices in Genoa, and branches in Milan and Naples, would welcome Canadian agencies in metals and machinery, etc., such as agricultural machinery, pumps, railway supplies, machine tools, wrenches, pliers, diesel and semi-diesel twin motors, 100 to 400 horse-power.

1513. **Metals, ferrous and non-ferrous, etc.**—An agent in Milan, Italy, would like to open negotiations with Canadian manufacturers of ferrous and non-ferrous metals, and of metal, woodworking, and machine-shop tools.

1514. **Lumber.**—A. Desio (Milan), Italy, manufacturer of artistic furniture, is anxious to buy Canadian lumber suitable for furniture making. He is also prepared to handle a Canadian lumber agency for after the war.

1515. **Wood-pulp.**—An import house in Milan, Italy, familiar with the wood-pulp requirements of the Italian market would like to hear from Canadian shippers of same, with a view to representation either now or after the war.

1516. **Arsenic.**—A Plymouth firm wants to import arsenic 99½ per cent. pure and to contain no impurities, especially sulphur, as it turns black when used in manufacture. Arsenic is generally imported in casks of 3¼ to 4 cwts. (112 pounds to cwt.).

Frank Mutton, Salesman

and salesmanager of very brilliant record—has completely caught a point of view which we have been presenting for years and years, and latterly, most of all. This point of view is:

Men engaged earnestly in the affairs of business will and do find immense help and illumination from reading each week THE FINANCIAL POST OF CANADA.

THEY get wheat sifted from the chaff. They get news and information about the things that really count in the conduct and movements of business and Canadian public affairs. They get a clear interpretation of news, events, happenings and factors that determine present and future developments. They read what big men have written or said about Canadian business and public affairs, and what exceedingly well-informed men glean about securities, markets, tendencies and other phases of business and investments; they read a commercial newspaper most interestingly written, admirably edited, sane and unpartizan. When a newspaper of this type and quality is available, the wonder is that any business executive or salesman or salesmanager tries to get along without it.

If we had written this letter ourselves, we could not have put it better:

Attention, Editor

Recently we sent you a subscription covering the delivery of "The Financial Post" to each of our Sales Agents and Salesmen throughout Canada. This was prompted by the fact, that in our opinion, your paper is the best barometer in Canada of what is going on in the different industries from one ocean to the other in this Country. Your paper contains information that is invaluable to any travelling representative of any firm.

Yours very truly,
F. E. MUTTON,
General Manager,
International Time Recording Company of Canada, Limited.
Toronto, Oct. 12, 1917.

Prior to his connection with International Time Recording Company, Mr. Mutton was Canadian manager of National Cash Register Co.

NO salesman or salesmanager can do his best work without knowing the kind of news which THE FINANCIAL POST exists to provide. Anything that multiplies a salesman's or salesmanager's knowledge and ability required in the selling of goods and in meeting buyers and customers, is likely to be a cheap, cheap investment. Mr. Mutton was and is a success because he incorporated into himself and his organization outer forces of power. Read his letter again.

OUR POINT IS:

BUSINESS and salesmanagers can most profitably do what Mr. Mutton has done: Subscribe for a copy for each man able to use knowledge of current business and public affairs in Canada to increase sales, to buy wisely, to know when to extend or contract credit, and when to go slow or speed up production.

GOOD USED EQUIPMENT

TRAVELING CRANES.

20-ton Browning Trolley, 5-ton zux., 56½" ga. (new).
20-ton Shaw, 56' 3" span, 110 V.D.C.
10-ton Case, 58' 3" span, 220 V.D.C.
10-ton Northern, 74' 6" span, 220 V.D.C.
15-ton Niles, 55' 6" span, 220 V.D.C.

PUNCHES AND SHEARS.

Single 48" tht., cap. 3 x 1¼", Providence.
Single 6" tht., cap. ⅞ x ⅞", Cleveland.
Single 15" tht., cap. ¾ x ½" (hand) new Doty.
Single, 9" tht., cap. 1 x 1", belted (3).
Single, 27" tht., cap. ¾ x ¾", belted.
Single, 32" tht., cap. 1 x 1", belted.
Double 15" tht. cap. ¾ x ¾" Fischer.
Double, Queen City, 12" thts., cap. ⅝" x ⅝".
Double, No. 3-A Royersford, 18" thts., cap. 1" x ⅞".
Double, No. 13 Williams-W., cap. 1¾ x 1", 20" throats.
Double 12" blades, bar shear, cap. 2" sq., crucible.
Univ. Plate Shear, 18" blades, cap. ¾", Cleveland belted.
Univ. Plate Shear, 26" blades, cap. ½", Lewis belted.
Guillotine Shear, cap. 2½" sq., belted, Perkins No. 6.
Guillotine Shear, No. O. H. & J., 6 and 7" blades (2).
Guillotine Shear, Fisher, 21" blade, cap. 8 x 2".
Squaring Machine 120", cap. 3/16".

MISCELLANEOUS.

Bolt Cutter, Acme 2", Class A, single head, dies.
Boring Mill, 10' Niles, Vertical, 2 heads.
Forging and Upsetting Machine, 1½" Acme, with dies.
Forging and Upsetting Machine, 2½" Ajax.
Hammer, 80-lb. Bradley, Cushion Helve.
Hammer, 35-lb. Maggowan & Finigan (Perfect), belted.
Rotary Planer, 36" Cleveland, motor driven.
Rotary Planer, 60" Cleveland, motor 60 cy., 440 V.
Pipe Machine, 8" E. C. & B.
Pipe Machine, No. 11 Jarecki.

GOOD CONDITION. PROMPT SHIPMENT.

22" x 8' Pratt & Whitney, B.G.
22" x 8' Martin, single purpose (2).
22" x 8' Davis, D.B.G.
24" x 8' Lodge & Shipley.
26" x 8' Fay & Scott, B.G.
2" x 24" Stevens Screw Machines.
No. 2 Warner & Swasey, plain head.
No. 6 Warner & Swasey, friction head.

ENGINE LATHES

6" x 30" Dalton, B.G., bench.
13" x 6' Filsmith, D.B.G., comp. rest.
14" x 6' McKenzie, taper attachment.
14" x 6' Lodge & Shipley, taper attachment.
15" x 6' Sebastian, B.G., comp. rest (3).
15¼" x 8' Carrol-Jamieson, D.B.G.
16" x 8' Monarch, B.G., compound rest.
18" x 10' Putnam, back geared.
20" x 8' Fifield, B.G., plain rest.
20" x 8' Hercules, heavy duty.
21" x 8' Bawden, heavy duty (2).
22" x 8' Pond, B.G., plain rest.
24" x 11' Pond, B.G., comp. rest.
26" x 14' Gleason, D.B.G.
31" x 16' Fifield, back geared.

DRILLS

12" Reed, 4-spindle.
12½" Avey, ball-bearing.
14" Excelsior, sliding head, lever feed (5).
15" Avey, high-speed, ball-bearing.
16" Barr, sliding head, lever feed.
20" Barnes, 3-spindle, lever feed (2).
20" Baker, tapping attachment.
24" Foote-Burt, heavy duty.
32" Cincinnati, heavy duty.
40" Bickford, back geared.
46" Allfree, back geared, power feed.
54" Hand-feed Radial.
D-8 Colburn, heavy duty.

GRINDERS

10" x 30" Landis, universal.
No. 1 Cincinnati, universal.
No. 2 Landis, universal.
No. 2 Sellers, universal.
No. 3 Modern, universal.
No. 3 La Salle, plain and surface.
No. 190 Wells, cutter and reamer (2).
2¼" Yankee, twist drill (3).

IRON PLANERS

20" x 20" x 5' Bertram (2).
24" x 24" x 6½' Bertram.
36" x 36" x 10' Pond, two heads
40" x 40" x 12' New Haven, power feed.
72" x 72" x 11' Canada, power feed.

MILLING MACHINES

Bertram, plain.
Brown & Sharpe, power feed, plain.
No. 2 Ford-Smith, plain.
No. 4 Fox, universal.
Gray Thread Miller.
Monarch, vertical.

SHAPERS

16" Petrie, back geared (2).
16" Canada Mach. Corp., back geared.
16" Cincinnati, back geared (3).
24" Gould & Eberhardt, back geared.
30" Morton, back geared, draw cut.

MISCELLANEOUS

4", 6" and 12" Power Hack Saws.
4½" Martin Cutting-off Machine.
No. 2 Grant Rotary Riveting Hammer.
⅜" Garvin Vertical Tapping Machine.
No. 3½ Greenerd Arbor Press.
No. 180 Brown-Boggs Power Presses (2).
No. 18 Can. Hanson & Van Winkle Power Press.
No. 2 West Tire Setter, Hydraulic Banding Press.
No. 3 Goldie & McCulloch Hydraulic Banding Press.
Bawden Copper Band Turner for 4.5 Shells.
1500-lb. Toledo Drop Hammer.
450-lb. Williams Drop Hammer.

2—13 x 8 Barnes Standard Engine Lathes.
1—13 x 5 Barnes Standard Engine Lathe.
1—10 x 4 Sebastian Standard Engine Lathe.

TURRET AND SCREW MACHINES

2—No. 6-A Potter & Johnson Automatic Lathes.
1—4½" Gridley Auto. Screw Machine, motor driven.
2—No. 4 Foster F.G.H. Hand Screw Machines.
2—No. 3 Foster F.G.H. Hand Screw Machines.
1—No. 5 Pierson F.G.H. Hand Screw Machine.
6—No. 2 W. & S. Plain Hand Screw Machines P.F.T.
3—No. 3 S. & K. Plain Hand Screw Machines
2—No. 2 S. & K. Plain Hand Screw Machines.
4—12" W. & S. Turret Lathes with air chucks.
4—16" W. & S. Turret Lathes with air chucks.
4—No. 107 Wells Hand Screw Machines.
2—2" Cleveland Automatic Screw Machines, jigger feed.
1—⅝-¾" Cleveland Automatic Screw Machine.

MILLING MACHINES AND GRINDERS

1—No. 2 Hendy Plain Milling Machine.
1—No. 0 Brown & Sharpe Plain Mill. Machine.
1—No. 1 Cincinnati Plain Milling Machine.
2—No. 13 Pratt & Whitney Lincoln Type Milling Machines.
5—No. 1½ Knight Milling and Drill. Machines.
3—Fox Hand Milling Machines.
1—Garvin Hand Miller.
1—No. 2½ Bath Universal Grinder.
1—No. 12 Modern Plain Grinder.
1—No. 14 Modern Plain Grinder.
1—No. 1 Landis Internal Grinder.
1—No. 2 W. & M. Surface Grinder.
1—No. 3 W. & M. Surface Grinder.

DRILL PRESSES

1—3-spindle 8" overhang Henry & Wright High Speed Drill.
4—6-spindle Fox High Speed Drills.
2—4-spindle Fox High Speed Drills.
2—4-spindle Fox High Speed Drills.
1—16-spindle Natco Drill.

SHAPERS AND PLANERS

1—36 x 36 x 10' New Haven Planer, S.H.
1—27 x 27 x 7' Cincinnati Planer, S.H.
1—24 x 24 x 6' Flather H.P. Planer, S.H.
1—16 x 16 x 5' Hendey Planer, S.H.

PRESSES AND HAMMERS

1—Waterbury Farrell O.B.I. Press, geared.
1—Wright Heavy Stamping Press, 76" housings.
1—No. 55 Toledo S.S., B.G., 10" stroke.
1—No. 55 Toledo S.S., B.G., 14" stroke.
3—No. 2-W Bliss Wiring Presses.
1—No. 5 Michigan O.B.I. Plain Press.
1—No. 5 Niagara O.B.I. Plain Press.
1—No. 4 Niagara O.B.I. Plain Press.

AIR COMPRESSORS

1—9 x 11 Cihcago Pneumatic Belt Driven Air Compressor.
1—8 x 8 Fairbanks-Morse Belt Driven Air Compressor.
1—8 x 8 Gardner. Single Belt Driven Air Compressor.
1—8 x 8 Ingersoll-Rand Belt Driven Air Compressor, inclosed.
1—8 x 6 Westinghouse Steam Air Compressors.
1—8 x 6 Ingersoll-Rand Belt Driven Air Compressor.

We also carry a large assortment of Steam Engines, Steam Pumps and Electrical Equipment of all kinds.

We are in the market to purchase machine tools large and small.

Complete 18-pr. Shrapnel Plant for Sale

PRINCIPAL ITEMS AS FOLLOWS:

1—Cutting-off Machine, with 15" three-jawed chuck.
1—Lathe, 28" swing, 8' bed.
1—Air Chuck, Double End Rough Turning Lathe.
1—Single End Rough Turning Lathe.
1—Single End Lathe, for base roughing.
1—Single End Base Facing Machine.
1—Double End Tool Grinder.
1—Jenckes Grinder.
2—Boring Machines, C.M.C., with turrets.
2—C.M.C. Lathes, equipped for nosing and tapping.
1—22" Davis Turret Lathe.
1—Jenckes Copper Band Lathe.
1—Gisholt Lathe, with 15" three-jawed chuck.
1—Lo-Swing Lathe for turning profiles.
1—Tool Grinder, 24" wheel.
1—Lathe, 14" swing, 6' bed.
2—Ford Smith Shell Grinders, complete.
1—17" LeBlond Lathe, equipped for wavy groove.
1—Drill Press, fitted for screwing in sockets.
1—16" Swing Acme Turret Lathe, for turning sockets, fitted with air chuck.
1—Double End Painting Machine, with ¼ h.p. motor.
1—Jenckes Air-operated Copper Band Press.
1—25 H.P. Canadian General Electric Motor, complete with starting box.
1—30 H.P. Westinghouse Motor, 550 volts, complete with starting box.
1—40 H.P. Canadian General Electric Motor, 2,200 volts, complete with starting box.
1—Westinghouse 40 H.P. Induction Motor, 550 volts, complete with starting box.
1—Nosing Press, for nosing shells.
1—5 H.P. Canadian General Electric Motor for same.
1—Hoskins Pyrometer.
1—Nose Furnace.
1—Tempering Furnace.

Jenckes Machine Co., Ltd.
Sherbrooke, Que.

FOR SALE

1—90' Thomas Spacing Table complete with indicator carriage, trolley carriage, stands, adjustable roller, racks, etc. Capacity: Plates, 48' long x 48" wide; angles, 8' long x 8" wide. Further particulars on application.

1—40 H.P. Horizontal Gasoline Engine complete and in running order.

1—30 H.P. Horizontal Gasoline Engine complete and in running order.

1—Air Compressor driven by Twin Cylinder Fairbanks Gasoline Engine. (Mounted).

Complete equipment for machining 4.5 H.E. Shell Nose Plugs. Capacity, 10,000 per day.

1—Powerful Hand Punching Machine.

1—Horizontal Steam Pump.

The Manitoba Bridge & Iron Works, Ltd.
Winnipeg, Manitoba, Canada

Trade Papers are Pioneers of Business Expansion

LATHES

1—No. 3 Foster Turret Lathe, geared head.
1—16" Fox Monitor Lathe.
1—No. 3 Bliss Spinning Lathe.
1—No. 5 Bliss Spinning Lathe.

GRINDERS

1—No. 4 Gardner Grinder.
1—Graham Double Disc Grinder.
1—Crescent Disc Grinder.
2—Ford Smith Shell Grinders.
1—12 x 42 Landis Grinder.
2—Dumore Electric Grinders.

SHAPERS AND PLANERS

1—24" London Machine Tool Shaper.
1—36" x 6' Bertram Planer.

PRESSES AND HAMMERS

1—23½B. Niagara Toggle Drawing Press.
1—No. 66 Consolidated Straight Sided Power Press.
1—400-lb. Bliss Drop Hammer.

PIPE THREADING MACHINES

1—2" Loew Victor, Belt-driven.
1—2" John H. Hall Belt Driven.
1—4" Loew Victor Motor Driven S.P. 110/60.
1—6" Loew Victor Motor Driven S.P. 110/60.

PUMPS

1—2 x 1½ x 3 Gardner Feed Pump and Receiver.
2—3 x 2 x 3 Smart Turner B.F. Steam Pumps.
1—12 and 18½ x 12 x 10 Worthington Compound Duplex Double Acting Steam Pump.
1—14 x 12 x 10 Worthington Duplex Double Acting Steam Pump.

STEAM AND GASOLINE ENGINES

1—8 x 10 Ideal High Speed Steam Engine.
1—450 Goldie McCulloch Corliss Engine.
1—15 H.P. International Stationary Gasoline Engine.
1—15 H.P. International Portable Gasoline Engine.
1—35 H.P. Heer Stationary Gasoline Engine.

BOILERS AND HOISTS

2—40 H.P. Locomotive Type Boiler.
1—60 H.P. Locomotive Type Boiler.
1—75 H.P. Return Tubular Boiler, full front setting.
2—100 H.P. Return Tubular Boilers, full front setting.
3—150 H.P. Return Tubular Boilers, full front setting.
1—6½ x 8 Napanee D.C., D.D. Hoisting Engine.
1—7 x 10 D.C., S.D. Hoisting Engine.
2—6 x 8 D.C., S.D. Mine Hoists.
1—7 x 10 Bacon Special Cableway Winding Engine.
1—4 H.P. Novo Reversible Gasoline Hoist.

MISCELLANEOUS

1—No. 5 American Gas Forge.
1—No. 16 American Gas Furnace.
1—6" Peerless Hack Saw.
2—No. 3 Waymoth Variety Lathes.
1—Waymoth Pointing Machine.
1—Crescent Universal Boring Machine.
1—20 K.W. D.C. Generator, 115 volts.
1—½ yard London Concrete Mixer, mounted on truck, with steam engine and boiler, complete with water tank and automatic loading skip.
1—20 H.P., 2-phase, 440-volt, 60-cycle Electric Motor.
1—75 H.P., 3-phase, 2200-volt, 60-cycle Electric Motor.
2—Bilton Gear Cutters.
1—Gray Sandblast Machine.

Machinery and Plant for Sale

LOCATION, BRITISH COLUMBIA

Plant completely equipped for manufacturing frogs and switches.

Equipment may be bought independent of plant.

Specifications: Modern Building, 100′ x 200′ on 7½-acre site. Ideal wharfage and C.P.R. spurs running into plant.

PRINCIPAL EQUIPMENT

MACHINERY

1—18" Barr Double Arm Punch and Shear.
1—26" Prentice Drill Press.
1—40" Buffalo Blower.
1—5′ Bellers Radial Drill.
1—2-ton Chain Block and Swedge Block.
1—48" Espen Lucas Cold Saw, 2 blades.
1—72" x 72" x 14′ Enterprise Planer, 2 heads and grinder head.
3—Air Hoists, 1 4′, 2 7′.
1—2" Acme Bolt Cutter, 3 complete sets of dies.
1—12 x 12 Rand Steam-driven Air Compressor, with tank.
1—36" x 36" Niles Planer, with two heads.
1—45" x 12′ Niles Two-head Planer, with extensions.
1—54" Putnam Gear Cutter, with cutters.
1—Gisholt Tool Grinder.
1—32" x 48" Brainard Slab Miller.
1—Power Hack Saw.
1—1½" Spindle Double-end Grinder.
1—48" Morton Draw-cut Shaper.
1—1210A Mason Boiler (T.P. 240, W.P. 160).
1—Dudley Car Frame and Trucks.
Several Electric Motors.

1—No. 3 LeBlond.
1—NEW No. 3 Cincinnati, complete.
2—No. 3 Kempsmith.
1—No. 15 Garvin.
1—No. 5 Cincinnati, quick change, double back gear.

MILLING MACHINES—Thread.
4—Morris-Thompson, arranged for motor drive.
10—No. 3 Lees-Bradner.
5—No. 3C Lees-Bradner, for 9.2" English shells.
2—Archdale, Taft, Pierce, for 6" English shells.

MILLING MACHINES—Hand.
1—No. 1 Bickett.
3—NEW No. 2 Pratt & Whitney.
2—NEW No. 3 Garvin.
10—NEW Becker, table 20" x 5½".

MILLING MACHINES—Vertical.
1—No. 2 Pratt & Whitney.
1—No. 3 Cincinnati Heavy Duty.
2—NEW No. 4B Becker.
1—Newton Vertical, Continuous, Motor Driven, for shell work.

MILLING MACHINES—Planer Type.
1—Ingersoll Slab 16" x 48" capacity.
1—NEW 17" x 5' Eynon Planer Type.
1—19" x 8' Beaman & Smith; in fine condition.
1—22" x 22" x 5' Ingersoll.
1—24" x 24" x 12' Bement & Niles.
1—24" x 24" x 14' Bement.

MILLING MACHINES—Lincoln Type.
2—Briggs type, high duty.
3—NEW No. 4 Sterling.
3—New American, No. 1.
1—No. 7 Becker.

PLANERS.
5—NEW 24" x 24" x 6' Powell, single head.
1—24" x 12' Detrich & Harvey, open side, one head, also milling attachment.
1—26" x 26" x 10' Gray, one head.
1—NEW 30" x 8' Powell, 2 heads.
1—30" x 30" x 8' Ohio, late model.
1—30" x 30" x 8' Garvin, open side, fine condition.
1—32" x 32" x 16' Niles, 2 heads.
1—36" x 36" x 10' American; 2 Heads.
1—36" x 30" x 12' Detrich & Harvey, open side, 3 heads.
1—36" x 36" x 8' Gray; One Head.
1—36" x 36" x 14' Cincinnati, 2 heads.
1—42" x 36" x 14' American, 2 heads.
1—42" x 42" x 19' Powell, 2 heads.
1—60" x 60" x 21' Pond; 3 Heads.
1—62" x 62" x 20' Canada Tool Works Planer: 2 Heads.
1—72" x 60" x 14' Smith Globe; 2 Swivel Heads.
1—17' Plate Planer, will plane any length of plate.

PUNCH AND SHEARS.
1—Waterbury-Farrell Alligator Shears, cap. 2½".
1—Cincinnati Gap Shears, 17" gap, 78" blade, ¼" capacity.
1—No. 411-G Toledo Squaring Shears, capacity 97", weight 12,600 lbs.
1'Badger Alligator, cap. ½, round stock.
1—Cleveland Punching Shear, 36" throat, capacity 1" x ½".
1—Providence Steam-driven Punch, 48" throat, cap. 3" through 1¼"; almost new.

SCREW MACHINES—Hand.
3—No. 0 Brown & Sharpe.
1—1" Pierce.
10—NEW No. 2 Owens Kent, wire feed, automatic chuck, 1 1/16" capacity.
4—20" Cincinnati Acme, friction geared head.

PUNCH PRESS WORK

What Can You Save?
By Using Parts Made in the Punch Press

Look over your standard parts, Mr. Manufacturer, and see what parts can be made (or could be made by slight change in design) by this process.

You will be surprised at the saving you can effect.

We make Blanking, Perforating, Drawing, Forming and all classes of dies and tools for plain or difficult stamping to suit the production required.

A Battery of presses is also available at our plant to manufacture parts for you with the understanding that you pay only for good parts made. Our facilities ensure prompt deliveries at right prices.

CUT YOUR SHOP COSTS

Nobody would think of putting 16-inch lathe work on a 30-inch lathe, then why leave small parts on a large Milling Machine?

A Steptoe Hand Miller or small power feed can be handled quickly and will cut your production cost. You will have less money invested in your Milling Machines and have more machines to do the work.

That same principle applied to your small planer work will cut the cost of planer work.

A Steptoe Shaper will do the work faster because it can be handled quicker.

Oxy-Acetylene Welding and Cutting

Two Thousand Joints on Ten Miles of Piping Made Leak-Proof at Less Cost

This illustration shows the groundwork of 2-inch ammonia pipe which forms the floor of one of the largest artificial ice rinks in the world. The size of this immense rink is 210 ft. by 90 ft. Ten miles of piping was required, and every one of the 2,000 joints was welded by the Prest-O-Lite Process at a substantial saving in cost over the old-style threaded joint. Moreover, the work was neater and smoother as well as stronger, because the welded joint is as strong as the pipe itself.

Prest-O-Lite PROCESS

has become standard practice on steel pipe lines in thousands of factories and plants. It is widely used in the construction of piping systems for steam, gas or air—in office buildings, hotels, factories, power plants, mines, machine shops and refrigerating installations.

The Prest-O-Lite Process employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene (ready to use) is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones. Provides dry, purified gas, insuring better welds, quicker work and lower operating cost. Adaptable for oxy-acetylene cutting by the addition of a special cutting blow-pipe.

Full instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the process quickly and easily. Write for valuable illustrated literature and data on work others are doing by this process, in construction, manufacturing and repairing. It may prove to be the solution of your problems.

Address Dept. C-107.

World's Largest Makers of Dissolved Acetylene

RELIABILITY

is an important quality of Famous Five files.

You can depend upon them to stay sharp for the longest possible time.

This is assured by the quality of our high carbon steel; the efficiency of its heat treatment; the perfection of our manufacturing process and the accuracy and eveness of the teeth.

Their RELIABILITY has made them standard grade tools in the estimation of all mechanics.

Specify them when ordering.

They are:

Oxy-Acetylene Welding and Cutting

A corner of one of L'Air Liquide Society's Canadian factories for manufacturing Oxygen and Dissolved Acetylene.

What that word "Service" means to you

The Oxy-Acetylene process, to be the means of saving you money, time and labor, must be supported by an efficient service for gases (Oxygen and Dissolved Acetylene). On this alone depends the success or failure of the process when applied to your industry. Neither effort nor money expenditure has been, or is being, spared to give the word "Service" its true and distinct definition, so that you may derive ALL the benefits from the process when applied in conjunction with "A.L.S." apparatus and "A.L.S." service.

When in the market for Oxy-Acetylene apparatus, before making a final decision, ask for particulars of our service which is worth many times more to you than the value of any apparatus you can buy. Being the pioneers of the process throughout the world from the time of its inception, our advice is invaluable to you and guards you against possible disappointment—and it is free for the asking. We shall be pleased to give you ALL particulars as to how you may benefit by the process.

Our success is your best guarantee of satisfaction.

DOUBLE BALL BEARINGS

Chapman Double Ball Bearings fit any adjustable hanger and the change can be made with but little delay to you.

Used in over 2,000 Canadian Factories. They have other good points too. Ask us to send full details.

The ordinary line shafting consumes from 15 to 60 % of power developed—

But the line shafting that's equipped with Chapman Double Ball Bearing will save 75 per cent of the friction loads making an average total saving of power from 15 to 30 per cent.

FORBES
Pipe-Cutting and Threading Machine

Ideal Machine for all Kinds of Work

Especially Fine Work

The "Forbes" is the ideal Pipe Cutting and Threading Machine for any job, but it is especially essential where the work in hand is of a high class order—where the reputation of your firm is at stake. Joints threaded by the Forbes Machines will bear the most critical inspection. They never leak.

It is the only machine on the market with receding gear which carries the dies into the pipe. It is also entirely self-contained, motor-driven and can be easily carried to its work.

Keep Your Grinding Wheels in Trim---

The Diamo-Carbo Emery Wheel Dressers

The Diamo-Carbo Dresser is being very generally adopted as a substitute for the expensive diamonds. Diamonds are becoming more scarce and quality is deteriorating. The quality of the Diamo-Carbo is uniform and in most places will do the same work as a diamond. They can be tried at our expense.

The Desmond Huntington No. 2 is the best dresser ever devised for use on large and coarse wheels.

We can make prompt deliveries of any type of Dresser desired.

SHOP ROOM

Labor and Production are the Main Factors Nowadays

Wouldn't a proposition interest you that would solve these problems? We have proven to hundreds of others that our New Improved Peerless High Speed Heavy Duty Metal Cutting Saw will do more work with less labor and save floor space. Instead of using several machines, one Peerless will do the work.

You are losing money in delaying your production and tying up ready cash when building.

Now can you afford to pass up this proposition? You take no chances, we allow you thirty days' free trial before you decide to purchase. No previous records or world-wide reputations are given consideration after this tool is once installed.

It takes but a moment for any manufacturer to realize the real value of this tool after a comparative trial. Many find them so profitable that they are ordering additional machines by express.

It will surprise you to note the large list of users. May we send you a copy?

PEERLESS MACHINE CO. 1607 Racine St. RACINE, WIS., U.S.A.

NO DRAGGING BACK ON THE NON-CUTTING STROKE

To protect users of Racine High-Speed Metal-Cutting Machines, we carry a large stock of the famous Racine H.S. Tungsten Blades.

A patented device of this Racine High Speed Metal Cutting Machine automatically lifts the blade clear of the work on every return stroke.

In this feature alone the Racine increases both output and endurance of the blade 500 per cent.

Therefore time saved—blades saved—would soon return to your pocket the reasonable cost of a Racine.

This fact—because it is a fact—could be proved to your satisfaction if you'd let us send you names of Canadian plants using Racines—one Montreal plant is using 168 — or if you'd let us ship a Racine on trial terms that you consider fair.

Write us to-day.

RACINE TOOL & Machine Co., 15 Melbourne Ave., Racine, Wis., U.S.A.

143-153 UNIVERSITY AVENUE - - TORONTO, CANADA

The St. Lawrence Welding Company, Ltd., Montreal, P.Q.

Office: 138 Inspector Street. Works: 39 Olier Street. Telephone: Office, Main 5779, Manager's Res., Westmount 3483

Consulting Engineers on all kinds of welding. Breakdown repairs handled at once, just 'phone us and we will be on the job by next train.

Oxy-Acetylene Welding of heavy cast iron frames, cylinders, gears, water wheels, etc.

Steel, any kind of welding on parts of large or small machines, tanks, digesters, boilers, shafts, brackets, etc.

Can be welded in place when necessary.

Electric welding on boilers, digesters, leaking tanks, etc.

Marine repairs undertaken by our Marine Welding Tug which is equipped with Electric and Oxy-Acetylene Welding Apparatus with Compressed Air Plant complete.

Oxy-Acetylene cutting of any kind of steel construction.

Portable Welding Apparatus of all kinds with trained operators always available to repair your breakdown at once.

THE ST. LAWRENCE WELDING COMPANY, LIMITED, MONTREAL

Manufacturers of Steel Tanks, Air Receivers, Welded Tanks, Etc. Electric Welders, Oxy-Acetylene Welders. Boiler Repairs. Lead Burning and Brass Foundry Work.

Specially Adapted for Grinding Straight or Tapered Shafts

The Fitchburg Grinder illustrated weighs about 4,100 pounds and occupies 52″ x 66″ floor space. In design it is conveniently compact; in build, uncommonly strong. It will save you price cost in the first place and repair cost later on. Occupies much less floor space, and, at the same time, does all the various grinding work with equal if not greater speed than machines of much larger capacity. **Write for interesting facts and Catalogue.**

Fitchburg Grinding Machine Co.

FITCHBURG, MASS., U.S.A.

WE BUILD THEM BY HUNDREDS

Standardized Production enables us to offer this powerful **Waterbury Grinder** at such a low price. It grinds rapidly and accurately, all flat surfaces, dies, punches, planer, lathe, and other tools. Has adjustable table and tool rest with large radius of travel. Rigid, 3-point table supports giving great steadiness. A reliable, practical grinding outfit.

Every Thread is Straight, Even and Accurate

The Chasers in an *H & G Automatic, Self-Opening Die Head* are set and held in place by a steel cam. That cam once adjusted, locks; there is no stoppage or changing in size.

The quick release not only issues the cutting of the thread to a given point every time, but permits cutting right up to a shoulder when required.

Simple, Strong and Compact.

Our booklet tells more. ***Drop a card for it.***

Eastern Machine Screw Corp.
New Haven, Conn., U.S.A.

The Drill Chuck that's Doing its Bit—and then some!

JACOBS IMPROVED DRILL CHUCKS are among the modern industrial devices that are meeting the war-time demand for quick, efficient and economical service. They keep down expense and increase the output. If you haven't used them, put some to the test.

The Jacobs Manufacturing Company, Hartford, Conn.

Handle 75-M/M Shells Just Once

Two Murchey Taps on your lathe completely finish this shell so that when it comes off the machine there is no more handling or re-sizing to do. Therefore

Murchey Tap Them

By using Murchey Collapsing and Adjustable Taps, you save two minutes or more on every 75-mm. Shell. Figure that in dollars for yourself!

Practically all the large plants of the United States are lining up with Collapsing Taps to thread the nose of this shell. No minute must be knowingly wasted.

Murchey Chasers are quickly adjusted to compensate for wear, and Murchey Adjustable Taps serve as long as ten solid Taps.

WRITE AT ONCE FOR ALL PARTICULARS.

Lightning Deliveries

—That is Murchey Service

Because War Demands Urge Utmost Output

HANNIFIN Air Equipment is taking the place of slow hand-and-wrench methods in hundreds of plants, the change to Hannifin increasing output from 20 to 100 per cent. And that is not all. Seven times in ten Hannifin Air Chucks and Mandrels are operated by men and boys new to machine shop work—and often by women.

So long as there is labor—male or female—capable of simply turning the Hannifin air control lever, Hannifin Air Equipment will enable you to meet the demands of war on a 100 per cent. efficiency basis.

To prove the altogether superior features of Hannifin Air Equipment, *we ship on trial.* And if you find a Hannifin Air Chuck is not all we claim—almost instantaneous in action, rigidly gripping, never slipping—please send it back.

Write now for catalog.

MacLean's Magazine

for JANUARY

Chasing the Submarine—by a Canadian

A CANADIAN, whose name is withheld, in the Motor Boat Patrol Service in the North Sea, tells in the January MacLean's the story of the work and life and triumphs of the Service to which he is attached. It is a fine performance by MacLean's to get this story for the Canadian people. Successes of this sort have made MacLean's go far forward in public favor during past months.

If the horrid and terrible submarine warfare and the conquest of this pest of the deep interest you, learn more about submarines and their capturing in the January MACLEAN'S, and pass on to others the news of this unsigned contribution.

Ships—more ships—and yet more ships

THIS is a very strong article which Miss Agnes C. Laut contributes. As usual she is very well informed. Regarding the duration of the war she voices American opinion when she says that it is likely to be long drawn-out. The United States people are buckling down to a stern struggle. At this time we want very much to read what well-informed, virile thinkers and writers have to say about the war, since things are not any too bright in certain directions. Miss Laut has a good deal to say about the shipping programme of the United States, and certainly she gives facts and sets us thinking as few writers do.

"Jim" by Robert W. Service

A POEM by this strong poet—a poem wrought amid the smoke and hell of battle, yet fanciful and tender. One wonders how men can write fanciful verse amid surroundings that seem so adverse to thinking and writing, yet some gifted can detach themselves and let fancy play; or is it that their minds see through the real and horrible—through the immediate environment into inner things? Whatever it may be, we ought to be glad for the verse that men like Service give us, remembering how and where it is produced.

Adam and Arthur William Brown, Brothers

ADAM BROWN is a Canadian short story writer of large promise. His brother, Arthur William, is one of New York's foremost illustrators. Both brothers have joined their gifts to make Hannibal Helps a mighty good feature of the January MACLEAN'S.

A New Serial by Alan Sullivan

ALAN SULLIVAN'S recent novel, The Inner Door, is being well received. Perhaps we have no better novelist of his type in Canada to-day. He writes books that show introspection and fine analysis. This serial, The Magic Makers, adds venture and mystery to psychological study, and is a rare good thing. Arthur Heming illustrates the story, which begins in Scotland and is transferred to Canada where the stage is set.

The Regular Departments of MacLean's

REVIEW of Reviews, Women at Work, The Business Outlook—are present in goodly measure. Oppenheim's The Pawns Count, Trench Pictures, and first-class illustrations by artists of note help to make the January MACLEAN'S good value for money.

At All News Stands, 20c.

HINTS TO BUYERS

MAXIMUM EFFICIENCY IN BELTLACING

A broken belt won't hold up production long if you repair it with

Patent Steel BRISTOL'S Belt Lacing

Pronounced the most efficient, because it is the easiest, the quickest and the best to apply.
No special tool is required. Simply a hammer and a soft block of wood to drive the sharp, staggered steel prongs through the belt in double rows and to clinch the points. The belt is gripped firmly without danger of cutting or weakening.

Send for samples and Catalog I-707.

RICH

Made by the
Rich Tool Company

FORGED DRILLS

Lower Your
Drill Bill
Because—

Not
Milled

Not one in one thousand snaps on the toughest drilling jobs, whether or not feed is heavy and speed high.

And Rich Forged Drills never burn nor bind when your drill presses are stepped to maximum speed and the feed crowded because the work is a rush job.

Rich Forged Drills are highest grade high-speed steel—and the fibrous grain is not cut and consequently weakened as in a milled drill.

Other reasons why Rich Forged Drills accomplish more than ordinary drills any user of Rich Forged Drills will explain. The particulars are also given in the Rich catalog. Write for it.

Consult us for shell plant, mill and factory equipment.

STANDARD MACHINERY & SUPPLIES, LTD.

Chains, Keys and Cutters, Hand Milling Machines

Morehead
Back to Boiler
SYSTEM

Save 8 to 20% of fuel—and increase the efficiency of your plant. The Morehead System takes condensation from steam lines and returns it to the boilers as pure, HOT feed water. Better service from steam lines—actually increases efficiency of steam heated machinery. Many users report that steam heated equipment is made to produce 50% greater volume. Ask us to send literature.

Carry Your Grinder to the Work Not Your Work to the Grinder

Thor

Portable Electric GRINDER

Equipped with Universal Motor for Operating on Direct or Alternating Current

110 TO 250 VOLTS

(Licensed Under Burke Universal Motor Patent.)

No. 6 Grinder-Wheel 4" x ¾" x ½"

ATTACH TO ANY LAMP SOCKET

Thor Portable Electric Grinder is equipped throughout with ball and roller bearings, and has a specially constructed motor, insuring speed, power, ease of operation and increased capacity.

IT RUNS AT 4,500 R.P.M.

Independent Pneumatic Tool Company

Office: 334 St. James Street, MONTREAL, QUE.

Toronto: 32 Front St. W.; Winnipeg: 123 Bannatyne Ave. E.; Vancouver: 1142 Homer Street

Let them know it's there

In complimenting us upon the results secured from their advertisement in this section, one advertiser said:

> "Of course we would not have sold it without letting people know it was here, that is obvious, and thanks are due you for letting the people know it was for sale."

If you have any old or used equipment for sale, let people know it's there. Your message in Canadian Machinery will be placed before the probable buyers of such equipment.

THE ELM CUTTING OIL COMPANY

645 East King Street
TORONTO

You have tried the rest. Now use the best for screw cutting and threading.

Our standard is uniformity at all times and a guarantee of quality with every barrel of oil produced.

PRICES ON APPLICATION

Without Delay **WHY?**

First: Because in our Extractor, we use a steel of different analysis than that in the taps themselves. Second: Because it is not tempered the same, for taps have to be left exceedingly hard in order to maintain their cutting edge and they are therefore brittle. Third: Because the Fingers of our Extractors are further from the axis of the tap than is any solid portion of the tap itself and they thus have a greater leverage in their favor; and Fourth: Because they are shaped to fit the grooves of the tap, using, therefore, the greatest amount of material.

Write for particulars of 60-day trial offer.

THE WALTON COMPANY
HARTFORD, CONN.

The Right Heat

is the only heat to work with if you are going to turn out good work.

An ordinary mechanic can keep a Gilbert & Barker Furnace steady and even, insuring a uniform temperature.

G. & B. are built right—from the ground up. The built-up construction with heavy sheet metal is reinforced with heavy angle iron straps riveted and bolted. The counterbalanced door clears the opening to full height, admitting the heaviest charge. Fire brick chamber lining, door lining and floor tile are of best quality.

And in every G. & B. furnace you get the benefit of 52 years of experience and study with gaseous and liquid fuels. Our line includes more than one hundred types of furnaces.

At present we are making prompt delivery on many types. Stock list 24 describes them all.

Gilbert & Barker

It's a "Mecol"

And that word "Mecol" stamps the character of the furnace. The best firms, the largest firms, small concerns with the systems and organization up to highest pitch have installed the "Mecol" products. They realize the value to be obtained from our furnaces.

Illustration shows our Gas Fired, Heat Treating Furnace with preheater. Consult us regarding your needs of this nature.

Mechanical Engineering Co., Ltd.
Three Rivers Que. Canada

3½-inch Slotter

7-inch Shaper

Combination

Three of the machines that by their cost-reducing features have established themselves "solid" with the home users and by these same merits are reaching out in foreign countries. A silent, but powerful message of the Rhodes efficiency.

Their capacity is greatly promoted by the adjustments which may easily and quickly be attached. For shaping, slotting, die making, tool making, etc., these machines stand paramount. An inquiry on your stationery will receive prompt attention.

The Rhodes Mfg. Company

Owned and Operated by the Jacobs Mfg. Co.

Hartford, Conn., U. S. A.

CLEVELAND SAND RAMMERS

FOR FLOOR, BENCH, PEIN AND FLASK RAMMING

Cleveland Sand Rammers are made in several sizes and weights, and are adapted for all kinds of Ramming in general foundry service.

The Piston Rods are packed with a resilient packing that conforms to the shape of Rod without retarding its free action, and prevents any dirt from entering piston chamber and working parts—Rammers are fitted with either Round or Flat Rods as required. Cleveland Rammers are light in weight, have high speed and practically no vibration, making them ideal foundry tools.

CLEVELAND CHIPPING HAMMERS

For General Foundry Work. Are furnished in any required size or weight for grey iron or steel castings; they have high speed, and are particularly adapted for fast chipping now required by piece-work operators.

BOWES AIR HOSE COUPLINGS

Over 1,000,000, in General Use

Bowes Couplings are instantly connected or disconnected.

Bowes Couplings are absolutely air tight under all pressures.

Above cut shows the Never-Slip Clamp attached to Bowes Coupling.

In Stock :—RIVETING HAMMERS, DRILLS, REAMING, TAPPING AND FLUE-ROLLING MACHINES, CORNER DRILLS, PORTABLE AND BENCH GRINDERS, ETC.

Catalog No. 12 mailed on request.

Never a Slacker—

THE "STRAND"

As near to wear-proof, as near to fool-proof, as forethought, skill and materials can make a mechanical device, is the "Strand" Flexible Shaft. Many times faster and better than the unprofitable hand way, it

Cleans Out All Shells

Not the size of a pin point of space on interior wall and base that it doesn't clean. It's the machine shell factories throughout Canada profitably use for cleaning, polishing, light grinding and drilling. Motor driven or arranged for countershaft.

Send for Catalog To-day.

Anybody Can Operate This Miller

and Turn Out a Pile of Work So Simple to Operate is the

"HENDEY"

Skilled mechanics are scarce these days—but anyone can run a machine of its simplicity and turn out work accurately and fast without trouble.

All Feeds positive driven through gearings giving 18 changes.

This is the universal type—designed to handle all milling operations performed on machines of this character, either with regular equipment or by aid of attachments, which can be supplied for increasing efficiency and scope of machine.

Lathes for All Purposes

C.M.C. Lathes have strength where strength is needed, and they embody every modern principle of machine tool construction that makes for accuracy, convenience and speed.

Below is our 18″ Engine Lathe with quick change gears.

Particular attention is drawn to the massive headstock design and construction. It is of the 3-step cone, double back-geared type, the cone having wide face for 4″ belt.

Our C.M.C. special belt shifter saves time and protects operators from accident.

This lathe fully described in our Bulletin No. 1000-A. *Send for a copy.*

CANADIAN MACHINERY AND MANUFACTURING NEWS

Vol. XVIII—No. 26 Office of Publication: TORONTO, CANADA December 27, 1917

Published by THE MACLEAN PUBLISHING COMPANY, LIMITED
TORONTO MONTREAL WINNIPEG CHICAGO NEW YORK BOSTON LONDON, ENG.

SMALL TOOLS

P. & W. Adjustable BLADE REAMERS

These reamers have eccentric relief and can be set to size without regrinding. They are unexcelled for design and simplicity and ease of adjustment. The eccentrically relieved blades are stronger than others, do not chatter, and produce a smoother hole. The hand, shell and fluted chucking reamers have interchangeable nuts, screws and wrenches. The bottom of a hole can readily be faced. By a simple adjustment of the blades the reamers can easily be set to size without regrinding.

PROMPT SERVICE

is assured at our nearest store, where P. & W. Small Tools are carried in stock. Place your order there to-day.

Our Sacred Duty

To contribute to Funds for relief does not discharge or liquidate the duty we owe to the brave men who are sacrificing their lives in the Trenches that we may live and enjoy the Blessings of Liberty and Happiness.

Better by far that we extend our Consideration in an effort to use in our Mills, our Factories, in our Cities and our Homes and all over this fair land, the products that Canadian labor produces, so that when the Boys come marching Home, they will be welcomed back to a Prosperous and Happy Canada.

Their sacrifice is worthy of our greatest effort--Our Duty is plain; Canada with Canadian Labor and Capital can produce, manufacture and distribute products sufficient to keep the Wheels of Industry Turning to the limit. The song of Prosperity and Happiness should ring out all over the land.

Let us sincerely pledge, to the extent of our needs, to purchase materials produced in Canada by Canadian Workmen, and the result of our efforts will return to us the Blessings of a Prosperous and Happy Nation.

The Steel Company of Canada
Limited

Hamilton Montreal

If any advertisement interests you, tear it out now and place with letters to be answered.

Our Material Duty

Consideration, Courtesy and Right Intent, all add to the sum of Human Happiness. Not only do they benefit those to whom they are extended, but they survive in various forms, and add to the well-being of the Business World.

Quality plus Service is the basis on which prices are made. Competition in Quality and Service is a healthy condition, but competition in price alone tends to business ruination. All Service rendered has a far-reaching effect which tends to a better understanding, and Quality is remembered long after the price is forgotten.

Let the Standard of the Canadian Manufacturer and Producer be as High as the Best, and "Made in Canada" officially stamped on any article correspond with the mark "Sterling" on Silver.

Let us attune ourselves to the Highest Standard of Quality and Service, and pledge to devote to this end all the means we possess, in the belief that Bigger Business will result through the gratitude of those we serve.

We are all one. No one can Thrive alone. No one Suffers alone. Industrial Prosperity tends to Happiness for all, and the Manufacturer who nails to the mast the Flag of Quality and Service is assisting in the development of a better and saner Business condition.

BRIDGEFORD

HEAVY DUTY LATHE

At Its Cost Cutting Work---

What those big chips say---

Big chips mutely but eloquently express big production. Here is a true picture of the Bridgeford in action in a well-known shop. It is rough-turning axles, taking off ¾ in. at the rate of 4 per nine hours. Material is 40 carbon steel. This is the kind of production needed to-day in the shops of Canada to meet with the demand for big and rapid production.

Designed for heavy duty, yet very simple throughout and convenient and easy to operate, it never fails to answer the hardest requirements within its range; and turns out work, the accuracy of which is never questioned.

Let us tell you of our full line of 26″ and larger Swing, Heavy Duty Lathes for every purpose.

BRIDGEFORD MACHINE TOOL WORKS

161 Winton Road N., Rochester, N.Y.

NEVER let it be said in this war of wars that we have failed to keep our troops well supplied. It is everyone's duty to support, to the utmost, these brave soldiers of the Republic.

There must be no shortage of Guns, Shells, Trucks, Aeroplanes, Ships, Etc.

4,000 TON STEAM HYDRAULIC FORGING PRESS FOR MARINE AND OTHER HEAVY FORGINGS.

The product of a modern steam-hydraulic press is denser and more homogeneous than can be obtained with the steam hammer, due to the effect of the blow of the latter not penetrating to the centre, in contradistinction to the uniform kneading effect of the press; while the amount of work that can be done by the latter at one time with little variation in temperature, strongly tends toward a better product. The greater uniformity and reliability of steam hydraulic forgings make their use imperative wherever high-class products are required.

"CoCo" Turning Steel

"CoCo" Goes on Working Long After Other Steels Stop

"CoCo" will do the same in your shop—will cut faster or longer than other steels. Here are some proofs:—

"CoCo" is cutting Semi-steel Castings at 100 ft. per minute, cut ½" deep. 30 hours continuous service between grinds.

"CoCo" is turning Cast Iron Hydrant Caps at 169 ft. per minute, feed ⅛", cut ⅜" and turns 4 hydrants per grind where less than one per grind used to be standard.

"CoCo" is turning .40 Carbon O. H. Forged Rams at 95 ft. per minute, feed ¼", cut 3/32" turning 3 rams in the same time it formerly took to do one.

"CoCo" Steel does not do stunts—It does the work. It will do yours as well. Ask us.

URANIUM

HIGH SPEED STEEL

Fewer Trips to the Grinder

The man who leaves his machine every few minutes to grind his tool is an expensive employee. Something is wrong. Nine times out of ten it is the high speed steel he is using.

By adding Uranium to high speed steel we have produced a cutting steel that is tough, that is strong, that will hold its cutting edge after ordinary tools have crumpled or burnt.

Cut down those expensive trips to the grinder by putting Uranium to work for you.

FORBES AND MEYRAN AVES.
PITTSBURGH, PENNA.

Seventeen Years in the Service of our Customers

YOU, as a user of Tool Steel, are vitally concerned with the Company manufacturing that steel. Obviously, for on it necessarily depend the quality of the steel and the service you receive.

THE VULCAN CRUCIBLE STEEL COMPANY was established in 1900 and has enjoyed a steady, normal growth—the result of satisfied customers. The personnel consists of experienced executive and practical men who have worked together for years. The equipment of the plant is modern and complete and assures you of prompt, dependable service—Natural gas, oil and electricity for melting; steam and electricity for mill driving, etc.

THIS COMPANY HAS ALWAYS CONSCIENTIOUSLY CARED FOR THE NEEDS OF ITS CUSTOMERS. In view of the conditions that have prevailed during the last two years, this is certainly a record of which to be proud.

These are some of the points that make relations with our customers so pleasant, and which are making the bonds of friendship and good-will stronger every day.

Roelofson 6-in. Banding Machine

YOU couldn't imagine a more sturdy, compact, serviceable machine than this! A glance at the illustration will show you for yourself. It has been used in Canadian munition plants since the munition business started, and is still giving absolute satisfaction. It's the machine you need if you make shells.

Look over the following outstanding features of its construction:

Integral (en bloc) construction assures perfect rigidity, permanent accuracy and desirable compactness.

Chucking with spring collet chuck insures accurate and speedy chucking.

Graduated feed dial, two cutting tools, and ample belt power insure output of accurate work in least possible time.

Machines are built for 15, 18, 60-pdr. and 6" shells.

Roelofson Machine & Tool Co., Ltd.

Head Office. 1501 Royal Bank Building, Toronto, Canada
Works and Warehouse: Galt, Ont., Canada

Immediate Delivery

To shell plants changing over from the manufacture of the larger sizes to 6" shells, our ability to make **immediate delivery** should be of especial interest.

And remember that the Roelofson is one of the few banding machines that have stood up from the first of the munition game and are still doing duty.

WRIGHT

High Speed HOISTS

IN your organization think over every detail, from the raw beginning to the finished product. Is there any unnecessary handling of the material? Some precarious method that momentarily threatens disaster? Some point or points where a speedy, strong hoist could handle the work quicker, more thoroughly and more economically?

The Wright High Speed Steel Hoists are featured with a non-fouling chain guide. Constructed of steel they represent the highest quality on the market. (One Canadian firm installed 70 in their shell plant). Let us give you further information on this subject.

ITS light and sturdy construction makes it adaptable to a multitude of uses.

DUMORE

PORTABLE ELECTRIC GRINDERS

To-day, the big call everywhere is for increased production. That means methods of greater efficiency—**in every part of the shop—in performing every operation.**

For grinding your tools, gages and dies and on similar work, use Dumore Grinders,—the highest speed portable grinders made.

The high speed of Dumore Grinders gives the correct surface speed to the various size of emery wheels. Another important feature of these grinders is their extreme accuracy. They leave no chatter marks, no bell mouth or taper to the work. That's because the armatures are dynamically balanced, eliminating all vibration.

There are three standard equipments, all operating on either direct or alternating current—all equipped with high-grade ball bearings—quality grinders in every way.

Wisconsin Electric Co.

1718 Dumore Bldg., RACINE, WIS.

Sold in England by
CANADIAN-AMERICAN MACHINERY CO., LIMITED
8 Bouverie St., London E. C., England.

Dumore Grinders are carried in stock by the following Canadian Distributors:

Aikenhead Hardware Company, Ltd.
Canadian Fairbanks-Morse Company, Ltd.
General Supply Company of Canada, Ltd.
Mechanics Supply Company, Ltd.
McNaughton-McKay Electric Company.
A. R. Williams Machinery Company, Ltd.
Northern Electric Company.
H. W. Petrie, Ltd.
Williams & Wilson, Ltd.
Wilkinson & Kompass.

EQUIPMENT A.

This equipment is for general tool room use. It includes High Speed Internal Spindle A, with a reach of 3 inches, speed 30,000 R.P.M. Motor spindle speed is 10,000 R.P.M. Comes fully equipped. Weighs 17½ pounds.

EQUIPMENT B.

For deep internal work. Extension arm has a 10-inch reach. Speed 10,000 R.P.M. Arm is interchangeable with internal spindle on Equipment A.

DUMORE JR.

PORTABLE ELECTRIC GRINDER

Here is another Dumore quality product—brought out to fill the demand for a light tool post grinder which will do accurate work.

All the popular features of the larger Dumore grinders are incorporated in the Dumore Junior. It's a high speed grinder—operates at 20,000 R.P.M. The armature is dynamically balanced so there is no vibration. This is done by special machines, designed by us and manufactured in our own shops. Dumore Grinders are the only portable grinders that have this feature.

The Dumore Junior is used for either external or internal grinding. It can be attached to any lathe, shaper or milling machine and as it is light it is very handy for portable use.

Let us send you literature on the Dumore Junior or any of the standard equipments. Write us to-day.

Dumore Grinders are carried in stock by the following Canadian Distributors:

Aikenhead Hardware Company, Ltd.
Canadian Fairbanks-Morse Company, Ltd.
General Supply Company of Canada, Ltd.
Mechanics Supply Company, Ltd.
Northern Electric Company.
McNaughton-McKay Electric Company.
H. W. Petrie, Ltd.
A. R. Williams Machinery Company, Ltd.
Williams & Wilson, Ltd.
Wilkinson & Kompass.

EQUIPMENT C.
Furnished complete with special spindle and chuck for grinding button dies. Speed, 50,000 R.P.M. Special spindle can be used with Equipment A or B.

THE DUMORE JUNIOR.

This grinder is furnished with extension shaft of 2½ inches to accommodate wheels as small as ⅜" in diameter. With this extension you can handle very fine work. Speed, 20,000 R.P.M. Weight 8 pounds.

Labor Shortage?

You can combat this problem with OLIVER TOOLS

Even the most up-to-date shops have a tool here and there that is not up to the efficiency mark demanded by war time conditions. Put Oliver Time Saving tools in their place and meet the skilled labor shortage.

In one Pattern Shop $30,000 worth of patterns had been destroyed in a flood, but with the Oliver No. 102 Universal Wood Miller the patterns were restored in a very short time.

On one set of locomotive patterns alone, over $600 was saved. This set had always cost around $1300, but now they do it the Oliver Way for a little over $600.

"The best cutting done by this machine is cutting pattern costs in half"

Send for printed matter covering our Wood Milling Machines.

HAYDEN

5 Spindle Automatic Screw Machine

This is the machine that's succeeding to-day. In designing it, we considered every requirement you could wish for in a machine for individual needs. This accounts for so many distinct features of superior worth found in the Hayden Five-Spindle Full Automatic—Capacity ¾-in. by 3 in.

Think of these:

16 Spindle Speeds
20 Time Changes
Low Threading Speed
Four Cross Slides
Five Longitudinal Slides
And there are 40 more.

Our latest catalog contains some meaty arguments for Hayden production.

Write for it to-day.

36"

The Cincinnati Tu-Speed Planer

With this machine in operation two speeds are acquired—
The right speed for roughing.
The right speed for finishing.
Two cutting speeds to the table and a constant return. The changing from one to the other is accomplished instantly while the machine is running.
You are losing money if you are attempting to get along with one speed. The single speed planer is handicapped.

Cincinnati Rapid Production Boring Mills

RAPID production—get those words fixed in mind in connection with Cincinnati Boring Mills. With them boring and turning is no longer a slow, tedious job. Even on the heaviest work they hustle the job through in a manner that amazes the man used to old-fashioned boring mills. Every job, big and small, is a paying proposition on a "Cincinnati." Convenient and adaptable; can be quickly changed from one job to another; handles a wide range of work. Everything necessary to big returns in boring and turning is embodied in the "Cincinnati" design. Get our bulletin and check it up point for point. We build several sizes, to meet all requirements.

CINCINNATI ACME

Flat Turret Lathes Screw Machines Turret Lathes

2¼"x26" Flat Turret Lathe with Chucking Equipment.

3¼"x36" Flat Turret Lathe with Bar Equipment.

Cincinnati Acme Flat Turret Lathes are noted for their rigidity, accuracy and efficiency. They are the double purpose machines adapted to both bar and chucking work with the use of simple and inexpensive tools. Among many features embodied in these machines are the cross sliding turret, head and bed cast solid, centralized control, etc. Capacity 2¼" and 3¼" bar stock and chucking work 12" to 16" diameter.

18" Universal Turret Lathe.

Cincinnati Acme Screw Machines are made for rapid production and are being used by all the leading manufacturing concerns of this country. Some of the features embodied in these machines are, head cast solid with bed, automatic chuck forged solid on end of spindle, renewable babbitt bearings and many others. Capacities, ⅝" to 2¼" bar stock, 11" to 20" swing. Made with plain head or friction back gears.

Cincinnati Acme Turret Lathes for rapid production, especially advantageous in brass shops, etc. Made in four sizes from 14" to 20" swing with plain or friction back gears. Furnished with plain, set-over, or universal turrets, chasing attachment, forming attachment and all tool accessories.

2¼"x11" Screw Machine.

If you have never investigated the possibilities of Cincinnati Acme Turret Machinery in your factory, you have missed an opportunity to increase your production and decrease your operating expense. Our catalog giving many more features and details of our machines, will be sent upon request.

Spraco Air Gun Painting

15,000 Shells per Hour

are painted with the Spraco machine shown above. It applies all kinds of paints, varnishes, enamels and lacquers. For shrapnel, high explosive shells, cartridge cases, etc., it is actually 500 times faster than the old hand way. Can you afford not to investigate an economy like this?

The unskilled operator simply points the gun and pulls the trigger. In other words, he directs the gun—the rest is practically automatic. In coatings thick or thin, free from streaks and brush-marks, he

Paints More in One Day than 12 Skilled Painters

Spraco Pneumatic Equipment with interchangeable nose pieces for the Spraco standard gun applies all kinds of liquid coatings to rough or smooth surfaces of metal, wood or any material. Rugged, perfected in every particular for painting indoors or out.

Send This Information

and Spraco engineers will gladly assist in solving your painting problem. They will probably show the way to a saving of at least 50%. Neither charge nor obligation.

1. Brief description of surface or object to be painted.
2. Name and nature of coating material.
3. Where unusual materials are involved it would be advisable to send us at least a one-quart sample. This will enable us to recommend the proper equipment after laboratory test.
4. Air pressure available.

If compressed air is not available, we furnish complete gasoline engine or motor-driven air compressor units.

Accuracy in

HEAT TREATING

is essential—

NOW

as never before

Made by

TATE-JONES & CO., Inc.

Established 1898
FURNACE ENGINEERS
PITTSBURGH - PENNSYLVANIA

IRRESPECTIVE of the size of the work handled Tate-Jones Overfired Accurate Temperature Annealing Furnaces will give uniform temperatures that can be accurately and easily controlled and maintained indefinitely.

Output is so vital to the nation's welfare at this time, that these features of "accuracy" and "temperature control" should be given first place when furnace installation is under consideration.

The saving of time in preparation, the elimination of spoiled work—which means a large amount of quickly finished good work—should give these Tate-Jones Furnaces the preference.

Another feature which is of prime importance at this time is the saving in fuel. These furnaces are scientifically planned and built. The ease of handling is also a great time and money saving feature.

Made in car type and in two types of stationary hearth: (1) all fire brick; (2) fire brick with cast iron bars imbedded in the top. Made for either gas or oil fuel or both.

For explicit information write for Bulletin No. 154. Mention your possible requirements and we will offer suggestions.

A Tate-Jones Overfired Car Type Furnace

RUDEL-BELNAP MACHINERY CO LIMITED

TORONTO MONTREAL

TATE-JONES SHELL NOSING FURNACES

The furnace illustrated is especially made for the nosing operation of shell manufacture. Through the opening in the front, which is water-cooled, the shells are placed. This permits them to become heated (by direct fire) to certain predetermined distance. The water keeps the body of the shell cool and prevents the heat from traveling back on the shell.

This furnace has a large combustion chamber below the work. The radiation from this chamber, together with the hot gases which strike the work as they leave the chamber at their highest temperature, cause the shells to become heated very rapidly.

These furnaces are provided with either oil or gas burners or combination oil and gas burners, as desired.

This furnace is made in two sizes, with fronts for different shells as listed below:

REGULAR SIZES.

No.	3" SHELLS Holes in Front	3" SHELLS Hourly Production	4.5" or 4.7" SHELLS Holes in Front	4.5" or 4.7" SHELLS Hourly Production	6" SHELLS Holes in Front	6" SHELLS Hourly Production	Weight
4058-N	10	100-125	7	70- 80	5	25-30	6,600
4059-N	14	140-160	10	10-115	7	40-45	8,600

TATE-JONES SEMI-MUFFLE TYPE FURNACES

For all annealing processes, pack and case hardening and general heat treating.

The combustion chamber is below the heating chamber with a fire brick slab separation between. Uses oil or gas fuel. Supplied with either oil or gas burner or combination oil and gas burner which permits the use of either fuel at will.

MADE IN 37 REGULAR SIZES.

Other Tate-Jones Furnaces for the Shellmaker.

Besides the above which are used for shell making, we can supply Tate-Jones Lead Bath Furnaces, Circular Semi-Muffle Furnaces, Lead Bath Nosing Furnaces, Enamel Baking Furnaces, Furnace for Banding, Cartridge Case Annealing, Flash Annealing.

There is a Tate-Jones Furnace for every possible use in the line of heat treating of metals

Reaming Deck Plates

2600 Holes Per Day

That's hastening shipbuilding!

And the CELFOR is the reamer that is doing this big day's work.

2600 15/16" holes reamed in tough steel deck plates 7/8" thick. What more convincing proof can be asked for than this real performance—something that actually has been accomplished?

The accomplishment of such tasks has been made possible through the advantages of the "twisted process" by which CELFOR drills and reamers are made.

With this process the sections are forged and twisted while hot. This gives the metal that greater density which makes the keen, durable cutting edge for which CELFOR reamers are noted.

PERKIN & CO., Limited, STANLEY WORKS LEEDS, ENG.

There's No Jar When This Planer Reverses—

Whitcomb-Blaisdell 24-inch Planer with Second-Belt Drive.

The Whitcomb-Blaisdell Second-Belt Drive cushions the reverse.

The "Second-Belt" replaces the usual bull-wheel and train of high-speed gears.

All the shocks and jars of rapid-running gears are entirely eliminated. The Second-Belt, while driving positively, imparts to the table a smooth, easy action.

It secures greater accuracy and better finish. Furthermore, it prolongs the life of the entire machine.

The absence of shock at the end of stroke—the "cushioning" of the reverse—permits the Whitcomb-Blaisdell to run at extremely high table-speeds.

Thus the Second-Belt Drive secures speed, smoothness and accuracy in cutting.

There are many details of construction in the Whitcomb-Blaisdell—details that mean production—that you should know.

Write for the Whitcomb-Blaisdell Planer Book.

FORD TRIBLOC

SAFE!

Conditions often make it necessary for men to work or walk directly underneath heavy loads held in suspension. At such times safety in a chain hoist is imperative.

Safety has always been one of the outstanding features of the Ford Tribloc Chain Hoist. In fact, the Ford Tribloc was born out of the need for safer and longer chain hoist service, and it was born free of the heritage of old patterns or tools "that had to earn their cost."

We were free to build a hoist along improved lines—and we did. We insured safety and durability for it by making all working parts of steel. Speed was increased and operating troubles eliminated by endowing it with the LOOP Hand Chain GUIDE that prevents "gagging." Efficiency was assured by using planetary type spur gearing.

A five-year guarantee speaks louder than self-praise. Get the details from Catalog No. 3.

SIDNEY *for*

"Give me a SIDNEY LATHE for real service!"

—so say those who, during these months of special stress, have been driving Lathes day and night—and who have put SIDNEY lathes to the supreme test of swift, endless and terrific service.

SIDNEYS make light work of heavy work.

Because of their mechanical perfection—fully explained in the descriptive pamphlet—it is an inspiration to work on a SIDNEY lathe. One duty after another swings along with uninterrupted smoothness.

One of the most efficient combinations standing behind the Soldiers and Sailors is a good mechanic at a Sidney Lathe.

This helpful SERVICE is "at your call."

Why not write us—or get in early touch with one of our Canadian representatives?

We invite you to thoroughly investigate the "SIDNEY FOR SERVICE" line of lathes before making additional requisitions for machines. They pay in service.

PETRIE Heavy Duty Manufacturing Lathe—*20-Inch Swing*

A Heavy Simplified Lathe for Rapid Production Work

Designed and built especially for Machining High Explosive and Shrapnel Shells up to and including 8-inch. Used and Endorsed by many of the Largest and Most Successful Shell Manufacturers.

DESCRIPTION

HEADSTOCK All Headstock journals are provided with well lubricated, renewable bronze bearings. Alternat heat treated steel and bronze washers take the end thrust and a simple adjustment is provided to take up wear. All gears are covered with neat and substantial cast iron guards that may be quickly removed when desired.

BED The Bed is of deep construction and width to give the greatest rigidity under heavy cuts. The shears are made extremely massive and the bed walls extra thick, providing the necessary mass of metal to absorb the vibration and shocks incident to heavy turning at high speeds. Heavy box girths tie the front and rear walls of the bed together at close intervals. Improved type wide angle V on front shear to take thrust of cutting tool. The rear bearing of carriage on bed is flat instead of V-shaped. At the rear of the bed planed pads are provided for attaching Taper and Forming Attachments.

CARRIAGE The bridge is very wide and extraordinarily deep; it will not spring under the heaviest cuts. The carriage is gibbed to the bed at the rear on the outside and will not lift under any conditions.

APRON The apron is of heavy double plate type affording a support or bearing to both ends of all shafts. Apron is tongued and grooved to the carriage, also bolted and dowelled. The feed friction has a greatly increased diameter and will pull the heaviest feeds and cuts without slipping. For engaging the friction a hand wheel several inches in diameter is provided and seats the friction firmly with very small effort on the part of the operator. All studs in apron revolve and simple but adequate oiling facilities are provided.

FEEDS Positive Gear drive through headstock spindle, steel gears in gear box, three rates of feed are provided for through sliding key type. Feeds per revolution of spindle being ⅛ in., 1-16 in. and 1-32 in. All gears in the feed train are fully guarded.

TAILSTOCK The tailstock is a massive casting, rigidly braced internally, and is provided with a long nose, making it unnecessary to extend the tailstock spindle for ordinary work. It is clamped to the bed by four large locking bolts operated at the top of the barrel. A simple binder locks the tailstock spindle in correct alignment; this clamp is located at the extreme front end, where it grips the spindle with the utmost rigidity and absolutely does away with distortion of any kind. The screw is unusually large to resist any buckling tendency. Suitable screws are provided for setting over for Taper Work.

EQUIPMENT Unless otherwise specified Lathes are furnished with 8 ft. bed, one driving plate, hand cross feed, heavy duty plain rest, necessary wrenches, and two-speed tight and loose countershaft. Forming attachment, turret tool post, hand or power feed bed turret, oil pan, pump, and connections can be furnished as extras when desired.

DIMENSIONS

Swing over bed	20 in.
Swing over carriage	11 in.
Length of Bed Standard	8 ft.
Distance between centres 8 ft. bed	40 in.
Width of bed overall	19½ in.
Height from floor to centres	40 in.
Dimensions of front spindle bearing	4 15/16 in. x 6¾ in.
Dimensions of rear spindle bearing	4 in. x 5½ in.
Diameter Nose of spindle	4 in.
Hole through spindle	1 5/16 in.
Diameter Tailstock spindle	3⅜ in.
Travel of Tailstock spindle	6 in.
Morse Taper—Centers	No. 5
Width of Tool Slide	12 in.
Diameter of Headstock Cones	11 in. and 14 in.
Belt Width	6 in.
Number of Feed Changes	3
Feeds per Revolution of Spindle	⅛ in., 1/16 in., 1/32 in.
Speed of Countershaft	110 R.P.M.
Size of Tight and Loose Pulleys	16 in. x 6¼ in.
Ratio of Back Gearing	6.7 to 1
Face of Back Gears	2¾ in. and 2¼ in.
Length of Carriage Bearing	30 in.
Width of Carriage Bridge	12 in.
Number of Spindle Speeds with Two-Speed Countershaft	8
Weight—Approximately, 8 ft. Bed	5,300 lbs.

PROFILE GRINDER

IS used to Grind, Concave and Convex Cutters, Cutters for Fluting Drills, Cutters that are irregular but having a number of true curves, accurately rounding the corners on Side Mills and Face Mills, Formed Tools for Screw Machines and Corner Rounding Tools for the Lathes, Planers and Shapers.

The maximum radius that can be ground is 3 inches, either convex or concave up to 12" dia.

The wheel carrying spindle is direct connected onto the motor shaft and has adjustable bronze bearings and carries a wheel 4" diameter, ¼" wide, ⅜" hole.

Complete equipment is furnished for all classes of work as follows:

1—Dumore Type D Universal Motor with 10 ft. of Wire, and Plug to fit any lamp socket, 110 volts, direct or alternating current.

1—4" x ¼" x ⅜" Hole Emery Wheel.

4—Work Posts.

1—⅞" Work Arbor.

1—1" Work Arbor.

1—Tooth Rest.

1—Gauge for radius setting.

All necessary wrenches.

Immediate delivery if you get your order in now.

The Cleveland Milling Machine Co.

PLAIN VISE

The dominant idea in designing this vise has been to incorporate compactness, rigidity and strength.

Our engineers' efforts have successfully combined these desirable features in the vise which is illustrated.

Vise opens with steel jaws	4⅜"	Depth	1½"
Vise opens without steel jaws	5⅜"	Width	6"

These jaws are removable for increasing the vise range or insertion of special jaws.

The regular equipment furnished with this vise is as follows:

One pair of Clamps and Bolts. One Crank Handle. Hardened and Ground Tongues.

We have a limited quantity of these vises on hand for immediate delivery. Write for circular. Price on application.

WORLD TRADE DEMANDS UNIFORM STANDARDS

Standard of the World

Guaranteed Accuracy 0.00001 in.

Far-sighted, ambitious manufacturers, in reaching out for world trade, have learned the necessity of basing their gaging system on size standards which are truly international. Johansson Standard Gages are used by Governments and manufacturers the world over to standardize sizes. Their usefulness in toolroom and inspection department is unlimited.

JOHANSSON GAGING SYSTEM

Interchangeability is insured by standardizing sizes and establishing limits. **The Johansson Adjustable Limit Snap Gage** can be quickly set to your sizes and limits. It's fixed "go" and "not go" sizes insure the production of work which is "just right." It reduces your cost of maintaining limit gages, because it is adjustable for wear, different sizes and changing limits

Immediate deliveries.

THE "NEW BRITAIN"
An All-Round Screw Machine

THE "New Britain" Six-Spindle Automatic is anything but a special purpose machine.

Its economic use is not restricted to the handling of work whose multiplicity of operations prevents its completion on the bar by machines of less tooling capacity.

This extra tooling capacity gives it an equal advantage on the ordinary run of work by permitting the subdivision of the longer operations—thus doubling and sometimes trebling production of machines of older type.

On work of still greater simplicity the Six-Spindle Automatic renders possible the production of two or three pieces at each indexing—cutting off in two or three positions.

If you are seeking means for cutting costs and increasing production an interview with the "New Britain" man will show you the quickest way. Write us.

The New Britain Machine Company

Automatic Screw and Chucking Machines **New Britain, Connecticut, U.S.A.**

GALVANIZE

to

PREVENT CORROSION

Rods, bolts, boat spikes, clinch rings and other steel pieces employed in the shipbuilding industry are galvanized in MEAKER UNITS at lowest cost and the galvanized coating produced is of uniform thickness, heavily applied and superior in every way.

Small parts used in the manufacture of aeroplanes and munitions are cleaned and galvanized at small operating cost in our INTERMITTENT ROTATING GALVANIZING MACHINES.

Several hundred manufacturers located throughout the world have proven that their investment in Meaker Unit is recovered by them several times each year—isn't it good business to own a galvanizing plant that saves each year an amount of money greatly exceeding its original cost—can you invest a moderate sum to better advantage? If you send your product out to be galvanized it will pay you to consider our proposal. If your galvanizing equipment is inadequate in size to meet present requirements, our Engineering Department offers you expert service without charge.

Booklets mailed on request contain much general information on the subject of galvanizing.

Every Machine Right at Hand

Another Pexto innovation! This time it's a handy revolving standard that swings every machine into the right position at a moment's notice. A time saver, a labor saver and a space saver all in one. A sturdy standard that keeps your machines off the floor and out of the way when not in use but keeps them right at hand when they're wanted.

Holdall Revolving Machine Standard

The illustrations on this page will tell you this interesting and practical story — the first one shows the standard without machines. The revolving turret will carry four machines on strong adjustable machine holders. It swings quickly to any position and easily locks with a handy lever. Can you imagine an easier way of handling successive sheet metal operations? Then, too, look at the six additional machine holders and you'll appreciate how this handy Pexto Standard will save valuable bench space and still keep your equipment within easy reach.

Now look at the lower illustration. Four machines on the turret ready for business. All the others ready to be put in position. All off the floor and a bench clear for action.

One man or four can work around this new standard. It's another high speed Pexto Helper that will increase your shop output.

We've just completed a new book which illustrates and describes this practical device in every detail. A copy will be on the way the moment we hear from you.

FOR PRODUCTION AND PROTECTION

Northern Electric

DAVIS

FLOOD LAMPS

For Production

Give your night timber gang the benefit of "electric daylight" from a battery of these lamps—in fact, give all your above-ground workings the same daylight working conditions at night—and watch your production increase.

For Protection

These flood lamps will put a circle of electric daylight around the workings that no marauder or prowler will dare to enter. They make the workings as safe at night as they are in daytime.

One lamp alone placed 60 feet above ground will illuminate an area of over 100,000 square feet.

When Oils are High and Labor is Scarce

what are you doing to meet these difficulties?

¶ Are you equipping your factory to fight against waste of materials, waste of time, labor and money? If not, you are not giving yourself nor your business a square deal. Your machinery deteriorates without proper care — without lubricants, and lubricants which have lost their original qualities, that are filled with dirt, grit and dust are not practical.

BOWSER ESTABLISHED 1885 **LUBRICATING OIL STORAGE SYSTEMS** THE STANDARD ALWAYS

are made to handle any capacity, to meet any requirement. There is no problem too small nor any too large but what we can handle it efficiently.

¶ Tanks are built to eliminate loss from leakage, careless storing and handling, evaporation, deterioration and space wasting. Provide a safe place for the storing of expensive and inflammable oils—the fire hazard is done away with.

¶ Pumps built to discharge, with accuracy, from one gallon to half-pint. Self-measuring; easy to operate; a check on amount drawn, and a time-saver.

¶ It can easily be seen that no careless workman can leave the spigot open and over-run the oil upon the floor. The workman saves time and labor—Bowser saves oil, space, time and labor —and you save the combination—MONEY.

In a few words, Bowser Systems insure a spotless, economical oil department.

The PHOTOSTAT—An Investment

(Reg. U. S. Pat. Off.)

The **United States Government** bought PHOTOSTATS for several Departments where copying was required. The records of the savings as published in the official report, follow:

Department of Justice (Period 6 months)		
Cost by previous method	$1,955.00	
Cost by Photostat method	794.50	
Saved by the Photostat		$1,160.50
Bureau of Animal Industry (Period 5 months)		
Cost by former method	504.00	
Cost by Photostat method	222.60	
Saved by the Photostat		281.40
Bureau of Chemistry (Period 5 months)		
Cost by former method	1,041.66	
Cost by Photostat method	210.00	
Saved by the Photostat		831.66
Navy Department (Period 5 months)		
Cost by former method	680.80	
Cost by Photostat method	225.00	
Saved by the Photostat		455.80
Department of Commerce and Labor (Period 5 months)		
Cost by former method	10,000.00	
Cost by Photostat method	1,657.60	
Saved by the Photostat		8,342.40
Total savings for period		$11,071.76

Since making these first installations the United States Government has bought over one hundred additional Photostats.

Does Your Business Need a PHOTOSTAT?

The Photostat, which is manufactured by the Eastman Kodak Co., is a combined camera and copying machine. The copy is made directly onto a roll of paper. No intermediate glass plate or film or other negative has to be made. By copying thus directly onto the paper, the copy is made very quickly and at a low cost. Also the copy is a facsimile of the original, so that there can be no mistake in it. The print is developed and fixed right in the apparatus itself; this part of the process, as well as the focusing and exposing, all being mechanical. The print is then removed to a tank of running water in which it is washed free from chemicals. Finally the print is taken from the water and dried and is then ready for use. The whole process is a rapid one, the average speed per print being from one to five minutes.

One Mining Company writes us that they use the Photostat as follows:

All progress maps, new work, etc., are laid out either in pencil or ink, and the Photostat copies are given to the underground foremen and shift bosses.

The same thing is done with regard to stope maps, positions of pillars, etc.

The use of blue prints in the machine shop, foundry and other construction departments is practically discontinued.

In the office all deeds, leases, etc., are copied as soon as they arrive and the Photostat copy is sent to the home office for filing. This has the advantage of giving an exact copy of the original, with all changes, signatures, etc., faithfully reproduced.

The Photostat copies at actual size, in reduction, or in enlargement.

Pencil Drawings, Sketches, Blue Prints, Shop Orders, Tracings, Maps, Pages from Books, etc.

A small book giving detailed description will be sent to you upon request to the

Chapman Double Ball Bearings

Here is a ball-bearing that offers sound and practical *economy* in power transmission. For Chapman Double Ball Bearings reduce friction loads 75 per cent., making an average total saving of power 15 per cent. to 30 per cent.

Further, they reduce lubrication expenses 95 per cent.

They have been constructed to fit any of the standard frames on the market, interchanging with self-oiling boxes of the same shaft size.

Chapman Double Ball - Bearings are substantial in construction and have a long and serviceable life, even under the most strenuous conditions.

Used in Over 2000 Canadian Factories

Saves 75% Shaft Friction

Saves 100% Re-babbitting.

Saves 95% Lubrication.

High cost of production makes **Chapman Double Ball-Bearings** worthy of your instant adoption. They'll save you money.

SURROUND YOUR BUSINESS WITH NEVER-FAIL BELTING

DUNLOP "GIBRALTAR" BELTING

SEAL OF QUALITY

"Strength of Gibraltar," while not our phrase, aptly applies to the rubber belting made by us and sold under the name **"Gibraltar Redspecial."**

It would be interesting to us if you, as a user of belting, would, before making your next purchase, get a verdict on **"Gibraltar"** from some of your friends.

Ask them if a stronger belt than **"Gibraltar"**—one giving more service with less loss of power—can be obtained anywhere; if any other product will survive heavy loads better; and, if, in withstanding the jerky strains consequent on fluctuation of power, any other belt can show a higher quality of friction in uniting the plies than **"Gibraltar Redspecial."**

We have evidence aplenty, in the form of voluntary testimony, which shows that for strength, durability and general service **"Gibraltar Redspecial"** is matchless. In the Biggest Saw Mills, Biggest Pulp and Paper Mills, Biggest Manufacturing Plants, one "driving force" is nearly always in evidence—Dunlop **"Gibraltar"** Belting.

For Drives, Rotaries, Edgers, Lath and Shingles Machines, or any kind of Transmission work, there is nothing better than Dunlop **"Gibraltar Redspecial"** Belting.

And what Dunlop **"Gibraltar Redspecial"** means to users of Transmission Belting, Dunlop **"Samson"** ensures to users of Conveyor or Elevator Belting.

NO LOAD TOO HEAVY

PHILADELPHIA
GEAR *TIME*

"Every Second Counts"

Worms or Worm Wheels?

THE United States is now calling on Canada to make shells. Canada will undoubtedly be calling on the United States for different machine shop equipment. If it's gears, we make them. All sizes from the largest gears made to the smallest. Nothing too big for us to handle and *handle quick*. For instance, worm wheels shown here. They have cast steel centres, phosphor bronze rims. Diameter 59.206, sixty teeth, 3″ pitch, 7″ face. If it's rawhide pinions, spiral or bevel gears or anything with teeth we are prepared to maintain equivalent service.

We are all in this war to win. Canada is doing her bit. We are out to do ours.

PHILADELPHIA GEAR WORKS

VINE AND 11th STREETS
PHILADELPHIA, PA., U.S.A.

LITTLE LEAKS and LITTLE PROFITS

STEADY dropping of water will wear away a stone—and steady little leaks wear holes in the P. & L. Statement.

The steadiest loss in most plants is in small power losses, which are only revealed by testing and are generally "simply accepted as inevitable" by the management.

BOND Ring Oiling Hangers cut these transmission losses to the minimum. The ring oiling device provides positive lubrication without waste of oil. Once the oil reservoir is filled, it requires no special attention for six months.

The universal adjustment corrects even the slightest misalignment, and thus cuts down the wear.

THE Spiro Compression Coupling is the greatest power-saving coupling you can instal. It is locked to the shaft by a graduated grip. The pull of the bolts on the two halves of the coupling acts on the spiral slotted sleeve until it grips the full surface of the shaft with a never-slip-hold. Every bolt pulls, and with every pull the grip grows.

And it can be removed as quickly as it can be installed.

STOP your power leaks by installing these two efficient power savers in your plant. The investment will yield a steady return with every revolution of your shafting.

The Bond Hanger Book describes our complete line of power appliances. Send for your copy to-day—now.

D. K. McLaren's

GENUINE OAK

GENUINE OAK

British Oak Tanned BELTS

There is more solid leather to the foot in D. K. McLaren's belting than in any other belting. This claim has been founded upon investigation and it is a claim we strive to live up to.

All British Tanned, conceded to be the best process known to science.

No shoulders, necks or bellies used—all hides are closely trimmed after being tanned, leaving the choicest part for the belting.

A vigorous system of inspection assures the maintenance of high quality throughout the process of manufacture.

Special Belts—If a situation arises requiring a special belt, get in touch with us—this is one of our specialties.

Wood Split PULLEYS

EVERY known precaution is used in the manufacture of our Pulleys; the arms are tenoned into the rim and a perfect give joint made; after this they are dowelled, each section of the rim is thoroughly glued with water-proof cement, under great pressure and nailed. They are then lathe-turned, inside and out, painted and varnished (2 coats) and guaranteed to be in perfect balance. Our Wood Split Pulleys transmit power economically and they are strong and lasting.

Let us put you in touch with some users of D. K. McLaren's Belts and Pulleys.

BELTS

THE J. C. McLAREN BELTING CO. OAK EXTRA TANNED EST 1856

J. C. McLAREN

Be Sure of the QUALITY of Your Belting

Quality in the belting you use determines to a great extent the output of your plant. The better the belting the better the output.

J. C. McLaren's products represent a **quality** in belting that is unsurpassed.

They are flexible, gripping, tough—they will carry all the power that any belting can possibly carry, yet wear long and always give good service.

The cost records of scores of plants bear witness to the fact of J. C. McLaren's belting economy and efficiency.

Sixty-one years of successful experience!
Put your belting problems in our hands.

J. C. McLaren Belting Co., Ltd.

MONTREAL TORONTO WINNIPEG

This photo was taken in a large shell shop "Somewhere in Canada." All the belting you see is "Anaconda"—6000 ft., 1" to 12", in 4, 5 and 6 ply, was supplied by us. Machines are working on 6" shells.

Anaconda Belting

THE right belting for Heavy Duty Drills, Grinders, Turret Lathes, etc. that use liquid cutting compound, because it is filled with a composition to withstand heat and acid, which also makes it waterproof.

"Anaconda" way, makes belts more waterproof, with less slip, less stretch and of greater general serviceability than any other belt of any kind—Leather, Rubber or Balata, including Canvas.

Our 64-page illustrated book is yours for the asking. Tells of

Transmission Belts	High Speed Belts
Conveyor Belts	Waterproof Belts
Elevator Belts	Gas and Heat Resisting Belts
Big Belts	Endless Belts
Small Belts	

CONTAINS CHAPTERS ON

The Matter of Stretch, Joining Belts, Fasteners, Belt Dressings, Capacities and Pulley Sizes, Belt Making, Belt Conveyors, Belt Elevators, Conveyor Equipment, Installing Belts, and other practical matters about belts.

WRITE FOR IT NOW.

"Anaconda" Belting reduces belt repairs and "take-up" to a minimum and materially increases the mechanical efficiency of the plant.

"Anaconda" will deliver you more service per dollar than any other type of belt made. A trial is convincing.

"Science, when well digested, is nothing but good sense and reason."

The Science of Chemistry and Harris Heavy Pressure Babbitt Metal

Chemistry is the keystone to modern industrial efficiency. It reveals the constituent parts of substances and can transform a weakness into great strength.

In no industry does the science of chemistry play a more important part than it does in the manufacture of high grade Babbitt Metals.

In the making of the famous HARRIS HEAVY PRESSURE BABBITT an expert metallurgical chemist guarantees every particle of the various ingredients that are included in its composition.

This never-ending maintenance of high quality has its reward in producing a babbitt "WITHOUT A FAULT."

We manufacture a Babbitt Metal for every purpose. Every one reliable and used the world over.

BERNARD

WOOD SPLIT PULLEY

Advantages of this Pulley in Your Shop—

Advantage 1—Bernard Wood Split Pulleys are lighter than solid or split iron or steel pulleys, permitting the use of less expensive shafting and hangers.

Advantage 2—Bernard Wood Split Pulleys lessen weight on bearings, reduce friction, and thus make a significant saving in power.

Advantage 3—Better belt surface reduces wear and thus effects a saving in belting.

These are advantages you can't afford to overlook. And there are other advantages too, which, when taken in the aggregate with three great advantages shown above, account for the general favor shown the **"Bernard"** line in the shops of Canada.

The Friction Clutch

Bernard Friction Clutch

An increasing number of repeat orders signify the success of this perfect-working Bernard Transmission appliance.

Bernard Friction Clutch is Safe, Simple and Reliable. Discard dangerous clutches that are a constant danger to men working near them, and use Bernard's "Safety First" clutch. Can be used in combination with pulley, sprocket or gears.

Bernard Double Friction Pulley

Here is another Bernard Transmission appliance that is recording marked success. Used on gasoline engines. Built to stand severe service. Simple in operation. Easy to attach to engine.

Its serviceable quality are widely recognized and is now used as a standard equipment on many high grade engines.

Special proposition to Dealers in all cities, where not represented.
Write now, our stock is complete, our price low, and quality unsurpassed.

The Joints of Morse Rocker-Joint Silent Chains

THE "ROCKER-JOINT" was devised over twenty years ago, long before the era of silent chains, as a scientific principle for eliminating frictional losses. It was immediately recognized throughout the mechanical world as *the one perfect joint.* The MORSE CHAIN CO. was the first to adapt this "ROCKER" principle to a chain joint, and the patent laws of every civilized country prevent its use on any other chain. Chain manufacturers everywhere have attempted to find a substitute for the "ROCKER" principle—some other principle which would also do away with the friction of the ordinary joint. But to this day the "ROCKER-JOINT" STANDS ALONE, the only chain joint which eliminates *destructive sliding friction.*

Fig. 1. The ordinary chain bending over the sprocket.

The ordinary silent chain joint is formed by a round hole at each end of each link, through which runs a round pin holding the rows of links together. This pin forms the axis about which the links twist in bending over the sprocket teeth. Obviously, as the load on the chain increases, the **sliding friction** on this single pin and on the holes of the link increases. A plentiful supply of lubricant and hardened bushings are essential to this joint and at best, wear and loss of power are certain.

Fig. 2. The "Rocker-Joint" on the sprocket.

The "Rocker-Joint" is formed by two special, case-hardened steel pins, both of them seated in the holes of the links, the seat pin in the row of links to the left of the joint, and the Rocker pin in the row to the right. As the chain bends in circling around a sprocket, the curved side of the Rocker pin rolls or rocks against the broad, flat side of the Seat pin. THIS IS THE ONLY MOVEMENT IN THE JOINT. There being no action between the hardened pins and the softer edges of the hole, bushings are unnecessary.

The "ROCKER-JOINT" depends upon its construction, not upon lubricant, for its life and efficiency.

SKF

THE use of S K F Ball Bearings is universal. They are used in all types of machinery and in all parts of the world.

Automobiles, motor lorries, tractors, agricultural machinery, electric motors, industrial trucks, textile machinery, cotton seed oil machinery, grain milling machinery, machine tools, woodworking machinery, paper making machinery, cranes, hoists, elevators and power transmission equipment are some of the places where S K F Ball Bearings are used to advantage.

CANADIAN SKF COMPANY, Limited
TORONTO, CANADA

246

What SKF Will Do!

Reduce friction to the minimum.

Prevent heating, wear and binding.

Prevent dry bearings and fire.

Permit high speeds.

Prevent oil leakage.

Keep product uncontaminated.

Improve production in quality and quantity.

SKF

THE widespread use of these bearings testifies to S K F quality. The highest attainable quality both in material and workmanship is always maintained. Added to this there are the exclusive S K F features—self-alignment, two rows of balls, single piece retainer.

Our Engineering Service Department is prepared to make recommendations on any application of ball bearings in which you may be interested. We have also issued a special catalog for each industry.

CANADIAN SKF COMPANY, Limited
TORONTO, CANADA

246

What SKF Will Save

60 to 80% of the friction load.

15 to 33% of the total load.

80% of the oil bill.

80% of the repair bill.

100% on trouble.

A large part of the belt wear.

Annoyance, delay and trouble common with plain bearings.

THE entire output of the majority of factories and mills, running into millions of dollars each year, is dependent on the service of belt pulleys.

If a pulley breaks or fails to hold on the shaft costly time and production losses occur.

Belt slip causes fuel and power losses amounting to thousands of dollars in many factories. The belt slip loss is a constant one which often seriously curtails the profit.

Every manufacturer should give the same careful attention to the selection of pulleys as to the selection of machinery for production.

This is done by the most efficient manufacturing organizations of the country. The Ford Motor Co., International Harvester Co., Western Electric Co., National Cash Register Co., Brown Shoe Co., B. F. Goodrich Co., American Car & Foundry Co., Packard Motor Car Co., and many others equally well known are all extensively equipped with and are large users of American Steel Split Pulleys.

There are over 25,000 "Americans" in the Ford Motor plants, over 20,000 in use in the Western Electric Company's Chicago plant and 25,000 in the plant of the Cadillac Motor Car Co., of Detroit.

AMERICAN STEEL SPLIT PULLEYS

Over three million and a half American Steel Split Pulleys have been sold because they have proved themselves to be the most efficient and economical pulleys in the market. They reduce belt slip and wind resistance to a minimum. "Americans" do away with useless weight on the shafting, and with the extra power it entails. They combine lightness with great strength.

American Steel Split Pulleys not only transmit maximum power with minimum belt slip, but endure higher speeds than any other standard metal pulley. They are guaranteed for double belt duty and any American Steel Split Pulley failing in service from a defect in material or workmanship will be replaced without charge.

Our booklet "Pulley Efficiency", is a most valuable one for manufacturers. Sent free on request.

Plant No. 2 recently erected to keep pace with the increasing business of The Dominion Forge and Stamping Company

SHEET METAL STAMPINGS and DROP FORGINGS

Growth of drop-forging and stamping work in this country has been steady and continuous for a number of years, and the magnitude of operations and extent of equipment installed serve to convey some idea of its increasing importance.

And as conditions revert to normal after the war this branch of Canadian industrial effort is fully expected to expand to great proportions.

It was not any more through the pressure of present demands, than faith in a prosperous future, that proved an incentive for the expansion of the plant of the Dominion Forge and Stamping Company.

Stamping and Drop Forging pave the way to economical production and only through this method of manufacturing may profitable competition be maintained.

MAKING FILES FOR FIFTY YEARS

IF fifty years of specializing and progressive experience in the manufacture of one thing tends to quality and efficiency, then the "Famous Five Files" are of the best quality and the most efficient.

For example: innumerable investigations were made before a formula was finally adopted for the steel. Each file is now made from steel best suited to the class of work for which it is intended.

The shape of the teeth has been subject to careful experiments. You can always get a "Famous Five File" with teeth that will cut fastest, and leave the best surface on any kind of metal.

Our hardening process insures long life to each file. Finally, every file is inspected several times during process of manufacture, and, if it shows the slightest defect, at any stage, it is rejected.

Every "Famous Five File" is mechanically perfect. Their qualities are standardized in the trade. Specify them when ordering. They are:

13-inch Engine Lathe

Record Shell Producers

Glance at the cut opposite. It shows battery of **Montreal General Tool Co. Single Purpose Lathes** in action on 6″ shells. They have been running steadily for two years in one of Canada's largest munition works, producing more shells per machine than any other type of tool.

This plant has turned out approximately ONE MILLION 6″ shells.

The chuck is instantaneous in action; positively cannot slip, very rigid; operated by simply turning a lever; 60 lbs. air pressure is sufficient. Very efficient on the following operations: Inside profile; base recess; groove and wave; rivet and face base; turn copper bands; and various other operations. Our claims for this machine have been substantiated by their records in several Canadian munition plants. Absolutely no repairs. No gears to break.

If it is chucks you are interested in look over this Lavoie Air Chuck. Simplest, strongest, and best on the market, 200 in use in one 6″ Shell plant, numerous others on all operations all over the country. Increases output by big margin. Has low air pressure. Note—The whole chuck is attached to front end of spindle, as in photo on solid spindle lathe.

Butted and Brazed **Bends and Shapes**

Don't Crowd Your Large Machines

You cannot manufacture small parts economically on a large machine. Steptoe Small Power Feed Millers and Hand Millers are especially adapted for that kind of work, a stiff, heavy tool that can be quickly handled and crowded to the limit. That is the machine to buy for small parts.

If your Planers are crowded take the small jobs and put them on a Steptoe Shaper and you will do them quicker and you will have less money invested in equipment.

STEPTOE SHAPERS "Just a Little Better."

CIRCULAR ON REQUEST.

John Steptoe Co., Cumminsville, Cincinnati, Ohio, U.S.A.

Have you Landis-ized your threads?

Are you using the Landis Die to cut your threads and thereby obtain a maximum production of high quality threads at a low cost?

If not, get in line with other progressive manufacturers and make your threading profitable. One customer writes, "We have made an increase in production of 30 to 40% and a saving in the cost of chasers of 50 to 60% since installing your machine."

Consider the design of the Landis chaser. It never requires annealing, hobbing or retempering, merely a slight grinding at the end renews it; right and left hand threads are cut with the same set of chasers; it is ground like a lathe tool, permitting any desired clearance without changing the cutting contour and it has a line contact with the stock, permitting of the highest cutting speeds.

Learn the many other distinctive features. Write for catalogues:—

We Can Ship A Forbes Promptly If Ordered Now

In your rush to increase production, do not forget the importance of having your pipe threading and cutting done quickly and efficiently at the time it is needed. Unless your pipe work is well done you cannot expect the lines to work at full capacity. If you are not yet short of labor you may be when you least expect it.

The FORBES machine enables one man to do the work usually requiring three or four men by the old, inefficient method. The FORBES is well known for its ease of operation, its clean-cut, burrless threads and cut-offs. It can be taken to the work anywhere. It is made for hand or power drive, bench or trench. The many time, labor and money-saving features of the FORBES Pipe Cutting and Threading machine have so increased the demand that we are being swamped with orders. In view of this condition and the advancing prices, as well as congested shipping facilities of the railroads, we wish to impress upon you the wisdom of ordering NOW, while we are able to make prompt deliveries. Or, if you will place your order at once, we will make delivery when you are ready.

Be safe. Order promptly and specify delivery. Telegraph at our expense if you're in a rush. Act before you lay this aside. Have you our catalog? Get that, too.

Champion Tools

Champion Turning Tool

Champion Expanding Mandrels

Champion Shop Furniture

Champion Vise

BULLDOG JAW AND A BULLDOG GRIP

The "CHAMPION" TOOL HOLDER grips the cutting tool with bulldog tenacity. Note the heavy extended lip which protects the tool. This holder stands up under the heaviest service. It can effect a distinct saving for you in breakage. A further saving is effected with this holder, since it can use up the small ends of cutters. High Speed Steel is expensive and difficult to obtain. Better economize your present supply—make it last longer and turn out more work by using "Champion" Tool Holders.

"CHAMPION" EXPANDING MANDRELS

They have no claws—cannot injure work. They are simple, accurate and low in cost. A complete set as shown makes any size mandrel between ½ and 6½ in. immediately available. They are the ideal equipment for economy in first cost and for the production of accurate work.

SHOP FURNITURE

Including Portable Benches, Steel Racks, Tool Stands, Trucks for moving boxes, heavy castings, etc., Lathe Pans, Steel Boxes, etc., etc.

The "CHAMPION" VISE will easily handle any odd-shaped work as well as ordinary shapes. It is more quickly positioned than any other vise. The work can be kept in proper position before the eyes of the workman in the best light without the necessity of stooping or other tiresome and awkward attitudes at the bench. A long stride toward correct work. Simple—Durable—Accurate.

Hill Publishing Co.,
10th Avenue & 36th St.,
New York City, N.Y.

Gentlemen:

Replying to your verbal request for some data regarding the first large cylinder Grinder built by the Norton Grinding Company of Worcester, Mass.

This machine was ordered by the firm of R. Hoe & Co., of New York about the latter part of December 1900 or early in January 1901.

In the early part of 1900 the writer became convinced of the necessity of finishing certain rollers and cylinders used in rotary printing presses, in a more accurate manner than we were able to do on an engine lathe, and after some preliminary investigation by the late Mr. Hoe he decided to give the order as above. The machine was delivered to us in 1901, and the writer of this, having charge of the department in which it was installed, tested it out on the work for which it was designed.

Mr. Chas. E. Norton came on and was with the undersigned several days trying out different grades of grinding wheels.

The machine was put in operation and has been running continuously since.

For several years after installation the writer kept watch and I can say that there were no repairs necessary other than the water circulating pump which has been renewed at least once; otherwise there has been no expense to speak of since we have had the machine.

Yours sincerely,

G. W. Church
Supt. Saw Dept.

GWC

Norton Grinding Company
Worcester, Mass.

The First Norton—Doing the Same Class of Work as when it started—17 Years ago

At the Hoe plant, 'way over on the lower east side of New York, you'll find a Norton Grinding Machine which is marked No. 1. For it was the first machine for cylindrical grinding we ever sold—back in the early part of 1900.

And it's not under glass as a relic, but out in the busiest part of the shop, lined up with a dozen other Nortons—**doing the same class of work that it was purchased for**—the finishing (to extremely close limits) of printing press fountain rolls.

We don't expect you to believe that we consider 17 years an exceptionally long life for **any** machine tool — but you must certainly be deeply impressed with the fact that with little or no repairs this machine will still deliver a product of marked accuracy.

Made in Half the Time

It takes but 5½ minutes—about half the time of the ordinary screw machine—to complete this carbon steel screw on the

No. 4 Universal Turret Screw Machine

Like the Universal Hollow-Hexagon Turret Lathes, this machine takes two cuts at one time, because the carriage has a power operated feed shaft, with eight feeds in either direction, independent of the hexagon turret.

In this example, while the threaded end is being turned and threaded by the hexagon turret, the opposite end is formed and turned by the square turret on the carriage.

Ask us to show how this machine could save time on your work. Send blueprints with rough and finished samples.

HUNTER

"DUPLEX"

Cutting Billets for 18 pdr. Shrapnel Shells

It takes a **good** saw to cut shrapnel stock—week after week—and to cut costs at the same time. Hunter saws are doing it in many plants.

No matter how large and difficult the job or how tough the steel the Hunter "Duplex" will go through it.

This cutting ability is due to the physical structure of the Chrome Vanadium heat treated plate and the positive method of holding the high speed steel inserted teeth.

Hunter Saw and Machine Co., Pittsburg, Penn., U.S.A.

You Need These Thin Fast Cutting Saws

Higher wages for men and higher prices for materials make you keenly on the watch for opportunities to economize in production. Here's one sound and practical way—use HUTHER BROS.' SAWS!

Note the cost-cutting speed, 35 to 55 peripheral feet per minute, feeding against the stock at the rate of ¾″ to 1½″ per minute, according to the nature of the stock and the capacity of the machine.

Huther Bros.' Saws are made to stand severe service. Two toughly tempered crucible steel plates firmly riveted together, form the body of this saw, and the teeth or inserts are of the finest quality high speed steel.

Require minimum amount of power to operate.

The photo at right shows a saw that had been in service nearly two years. Teeth ground back but ⅝″ from front.

Represented in Canada by: **Williams & Wilson, Limited, Montreal; A. R. Williams Machinery Co., Limited, Toronto, Winnipeg, Vancouver**

UNIVERSAL SERVICE IN YOUR TOOL ROOM

Grand Rapids Grinder No. 2

Most serviceable Grinding Machine at any price—yet the price is very moderate.

This Grand Rapids No. 2 gets closer to the literal meaning of *Universal* than other tools of its kind.

Your milling cutters, your reamers, your gauges and all like tools are easy propositions for the Grand Rapids No. 2. It grinds every shape any other machine will grind, and two, three or four-lip drills, countersinks, etc., too. And it does each and every job *efficiently*.

The secret of this machine's superiority is found in its unique, but simple construction. Simplicity of construction tells the *why* of its moderate price. Yet its construction is high-grade. Has genuine crucible steel spindles, ground and running in ring oiled bronze bearings, and many other features worthy of your investigation in these days of greater production.

WRITE FOR THE FULL STORY OF GRAND RAPIDS NO. 2 GRINDER.

GRAND RAPIDS GRINDING MACHINE CO.

18 Ottawa Avenue, N. W.

GRAND RAPIDS, MICHIGAN, U.S.A.

A Force for Greater Production

This is the Impellor of the "Fulflo" Lubricant Pump

The impellor shown above is the only pumping part of the "FULFLO" Pump. Note its simplicity, no gears or other parts grinding one against the other. It does not contact with any other part as you will see in the cut-out view of pump. Therefore, there can never be any impairment of its pumping action through wear. This construction also positively precludes clogging and insures large, continuous volume.

Summarized briefly—the "FULFLO" lubricant pump *does* have the following features without which a lubricant pump is not all that it should be.

First—Has long pumping life.
Second—Is Non-clogging.
Third—Delivers large, continuous volume.
Fourth—Cannot lose its prime.

The lubricant pump you buy should contain these very essential features and we believe you will agree with us that we have shown you conclusively that the "FULFLO" does possess them. Check up our claims and the proof offered.

COMMERCIAL TRUCK COMPANY OF AMERICA
MANUFACTURERS OF
ELECTRIC COMMERCIAL VEHICLES

TWENTY-SEVENTH & BROWN STREETS
PHILADELPHIA, PA.

August 23, 1916

The Cincinnati Lubricant Pump Company,
Cincinnati, Ohio.

Attention of Mr. F. M. Cobb, Sales Manager.

Dear Sir:-

We are pleased to state that the Fulflo pumps which we have in use in our shop are giving entire satisfaction and are a step in advance of the old gear type pump

If you could persuade some of the machine tool builders to apply this pump to their machines, there would be a decided improvement in the effectiveness of the machines as a whole.

Wishing you success, we remain

Yours very truly,
Fred Whitney
General Manager.

THE BRIGHTMAN MANUFACTURING CO.
MANUFACTURERS
"SHAFTING"
STRAIGHTENING & SHAFTING MACHINERY

SOUTH COLUMBUS, OHIO, U.S.A. Feb. 20, 1917

The Cincinnati Lubricant Pump Co.,
Cincinnati, Ohio.

Gentlemen:-

We have gained very satisfactory results with "Fulflo" pumps and find them very superior to the geared pump, due to the fact that there is less wear through the rotor.

After more than a year's experience there is nothing too good that we can say for the "Fulflo".

You may rest assured that if we had not found "Fulflos" to be the best obtainable we would not be supplying them as our standard pump equipment.

Yours very respectfully,
THE BRIGHTMAN MANUFACTURING CO.,
Superintendent

Two Cuts

Simultaneously

One up, the other down. This is what makes the **Hurlbut-Rogers Cutting-Off and Centering Machine** virtually double the output and reduce the cost per piece about one-half.

The Hurlbut-Rogers Machine gives you capacity of two machines at the expense and in the floor space of one machine.

We build them for hard work and the utmost in accuracy—and their **GREAT SUCCESS ON SHELLS** shows it.

Cutting-off Economy

5-inch Cone-Driven Machine

Let us go into details.

HURLBUT-ROGERS MACHINERY CO., South Sudbury, Mass.

FOREIGN AGENTS—England, Chas. Churchill & Co., Ltd., London, Manchester, Glasgow and Newcastle-on-Tyne. H. W. PETRIE, TORONTO, CANADA.

Specially Adapted for Grinding Straight or Tapered Shafts

The Fitchburg Grinder illustrated weighs about 4,100 pounds and occupies 52″ x 66″ floor space. In design it is conveniently compact; in build, uncommonly strong. It will save you price cost in the first place and repair cost later on. Occupies much less floor space, and, at the same time, does all the various grinding work with equal if not greater speed than machines of much larger capacity. **Write for interesting facts and Catalogue.**

Fitchburg Grinding Machine Co.

FITCHBURG, MASS., U.S.A.

We are not Playing Checkers

Every man-jack of us at the Carborundum plant is working like the proverbial beaver, for never before has there been such a demand for Carborundum and Aloxite Products.

We are doing our level best to meet this big demand—enlarging our plants, increasing our forces, speeding up production—we are even building a big 20,000 horse power furnace plant in Canada in our efforts to keep up with things. We have a definite service to perform for we are helping to produce the necessities of war.

Carborundum and Aloxite Products are Doing Their Bit

They are grinding shrapnel shells, high-explosive shells, rifle barrels and parts—grinding bayonets and sabers. They are grinding a hundred and one different parts of the aeroplane and the auto truck, the machine gun and the field gun. They are shaping armor plate and grinding car wheels; grinding plowshares, and the tools of the metal-working trades of the world. They are grinding torpedo tubes and torpedoes, grinding submarine engine bases; beveling the lenses of periscopes and buffing the soles of the army shoes and grinding the shears for the pocket kits of the "Sammies." They are doing a thousand and one war tasks quicker and better than they have ever been done before.

Carborundum and Aloxite products are surely doing their bit, but with it all we haven't neglected for one instant our regular patrons—we are doing all in our power to keep up with the pace; to keep up to the standards of Carborundum service.

NEW YORK CHICAGO BOSTON PHILADELPHIA CLEVELAND CINCINNATI MILWAUKEE PITTSBURGH GRAND RAPIDS

INEFFICIENCY MUST GO

There's every reason now why inefficiency must go—time is precious to the human race, every manufacturing minute counts—and time costs money. If a piece is to be sawed, the mechanic's time must be conserved as far as is possible and wasted metal and scrapped pieces must be reduced to the lowest figure.

This calls for quick, labor-saving cutting.

Now, if a new, sharp saw is put into a frame or machine, it will not necessarily do efficient cutting—it may clog, dull or snap because not suited to the shape or kind of metal. These mishaps may be the result of selecting a saw with teeth too small or too large; the teeth may have too little or too much set; or the saw may be too soft or too hard.

Begin the selection by thinking of the

Starrett Hack Saws

this name "Starrett" is already in your mind connected with fine tools. Next determine *what* Starrett Hack Saw. They're all numbered and each number bristles with significance. It's just as important to use the right numbered Starrett as it is to use the right lathe tool, or the right milling cutter, or the right file. Of course, all these tools and hack saw blades will do some work, but a wrong use won't chase away that word "inefficiency."

But the right selection is not difficult—turn to page 208 of the Starrett Catalog No. 213—there you will find the numbers that correspond to most efficient usage. Remember that using the right numbered Starrett is the utmost in Hack Saw Thrift for such a blade Cuts Quicker—Lasts Longer.

42-752

Starrett Hack Saws *are Unexcelled*
Just as* Starrett Tools *are Unexcelled

INEFFICIENCY MUST GO

For highest efficiency in severing metal the complete outfit should be Starrett—blades—hand—frame—machine.

The Starrett Hack Saw Machine gets the most out of a blade. The stroke can be adjusted to use the full length of the blade on every piece cut.

It prevents breakage of blades and stripping by easing the saw onto the work by means of a dash pot.

The saw doesn't drag on the return stroke, and an automatic locking device holds the saw at any height when stopped.

A special bulletin describes this machine.

TOOL ROOM SURFACE GRINDER

This Machine is BUILT WITH EXTREME CARE

We Even Balance the Driving Pulleys!

That's an example of how painstaking we are in the details of the construction of this justly famous grinder. Then there is the best of experience behind our efforts.

Result: a better-than-ordinary grinder, a grinder capable of exceptional *speed, accuracy, strength* and *simplicity.* Don't you think this is a good machine to buy? Presents rigid grinding surface and large tray and water pot combined. Easily adjusted.

SPECIAL MACHINERY

Put your requirements up to us—experts on special designs. Product, price and service top notch.

J. E. WING & SON, Hamilton, Can.

WE BUILD THEM BY HUNDREDS

Standardized Production enables us to offer this powerful Waterbury Grinder at such a low price. It grinds rapidly and accurately, all flat surfaces, dies, punches, planer, lathe, and other tools. Has adjustable table and tool rest with large radius of travel. Rigid, 3-point table supports giving great steadiness. A reliable, practical grinding outfit.

Oldest Portable Tool Manufacturers in America

ELM CUTTING OIL

Cutting the Costs

We specialize in three kinds of oils which have proven their ability to substantially cut costs: *Cutting, Drawing* and *Motor Oils.*

Elm Cutting Oil. Illustration shows the oil at its cost-cutting work. Its use results in clean-cut threads, longer life for tools, larger production and a lowering of cost. It is antiseptic and pleasant to work with too.

Elm Drawing Oil. Adapt this oil and you'll have no scratches from tools. Tools last longer, too, and production is large and more economical where Elm drawing oil is continuously used. Antiseptic and pleasant to work with.

Elm Motor Oils. Less carbon and many more miles per gallon is always the result produced by the use of this **Elm** product. Their use assures lower costs, less motor trouble and better service in general.

Cost of production is above normal just now. Every means by which costs can be reduced should appeal to you. Elm products offer you a saving worth while. Try them. They are cutting costs for others and will cut costs for you.

ELM CUTTING OIL COMPANY, TORONTO

Butterfield

TAPS, Solid and Adjustable

For speed and accuracy, for strength and durability — Butterfield Taps.

Look at these tools—don't they impress you with their power and efficiency?

Why They're Favorites

It is the knowledge *just how* to make the best, together with the employment of the highest skilled labour and best steel, that have made BUTTERFIELD PRODUCTS the favourites with all discriminating tap users. Our taps are as near perfect as it is possible to make them, due largely to our special hardening and tempering process, the result of thirty years' experience.

For faster speeds, faster feeds, for a still more rapid production, *Butterfield* taps will set the pace.

Give them a trial.

Butterfield & Co., Inc.
Rock Island, Quebec

REECE'S SCREW PLATES

Give Your Men This Tool

The modern way is to study your men and give them tools that they like. The reward is better work, increased output and all attendant advantages. Introduce Reece's screw plates into your plant and watch the output take a jump upward. Your men will enthuse over them!

Reece's Screw Plates are ADJUSTABLE, and have all the advantages of a solid die with none of the disadvantages. To cut smaller, simply turn in the adjusting screws on either side of the collet. To enlarge turn these screws out, loosen cover, push back dies and tighten cover.

Impossible for dies to loosen and cut cross threads, because guide portion is CAST SOLID with (and is a PART of) collet.

You can cut PERFECT THREADS CLOSE TO THE SHOULDER with a single cut. No "backing and filling." Another advantage—can be reversed in collet and used in a lathe or other machine.

Reece's screw plates are practically everlasting. Try one in competition with others and note the difference!

U.S. Hand and Weight Milling Machine

The most conclusive milling costs recorded prove the actual cost of milling small parts approaches the actual cost of milling large parts. The milling of small parts costs one-third to one-half more in proportion. Nor do the figures we have in mind take into account the frequent and unprofitable holding up of large parts owing to big millers being glutted with small milling work.

This serious inroad on your profits the U.S. Improved Hand and Weight Milling Machine positively overcomes. It

Mills More Small Parts At Away Less Cost Then Your Big Miller

It so greatly increases output of small parts as to actually reduce milling cost per part 1/3 to 1/2.

Neither in power nor capacity is any other miller of similar size its equal.

Its vertical and horizontal feeds are independent. Work is held close to the table; speedy profiling is possible, and in milling long or heavy parts there is no danger of breaking cutters.

Table is operated by hand lever, or crank feed with rack and pinion. The pinion shaft, mounted in eccentric bushing, allows for adjustment of pinion with rack. With weight attachment furnished, both table and head are fed automatically, and adjustable stops for both table and head limit the travel in either direction.

If Desired

Two-step cone and side pulleys, which take 2½" belt for heavy work, will be furnished instead of the three-step cone illustration shows, which takes 1¾" belt.

Regular equipment includes: Countershaft, oil pot, two-feed handles, wrenches and weights.

For catalogue write to-day.

THE UNITED STATES MACHINE TOOL CO.

CINCINNATI, OHIO, U.S.A.

WELLAND

Offers the Strongest Combination of Industrial Advantages in Canada

Twenty-five big industries of continental reputation have proved this during the last five years.

The International Nickel Company sent their engineers out to examine industrial sites. They examined prospective sites from the Atlantic to Lake Huron. The result of the investigation is the building of a five million dollar plant in the Welland Canal zone.

Why?—Because Welland offers the

Cheapest Power in Canada

Unrivalled Rail Facilities

Lake Shipping Advantages

LAKE SHIPPING

Railroad Rates:—Rates from Welland to the North-west and Pacific Coast, all rail, are the same as from all other manufacturing points in Eastern Canada lying between the Detroit River and Montreal. These rates are fixed by the Board of Railway Commissioners for Canada.

On account of the close proximity to the border, Welland is in the Buffalo switching group and takes the Buffalo rates from the east and south and enjoys quick delivery on all raw material imported from the United States.

The fact that all of these roads centre here creates competition, and is the biggest lever the manufacturers have for securing efficient service from the railroads.

The seven railroads are as follows:—

Grand Trunk—Michigan Central—Toronto, Hamilton & Buffalo—Canadian Northern—Pere Marquette—Canadian Pacific—Wabash.

Power Rates:—Welland is the industrial hub of the Niagara Peninsula where an unlimited amount of electric power is available and sold at competitive prices, owing to the numerous power companies represented there.

Every factory in Welland is driven by electric power supplied by the Ontario Power Company, of Niagara Falls, which is about twelve miles east of Welland, or from the Dominion Power Company of DeCew Falls, which is about twelve miles north of Welland. The fact that we have competitive companies operating in this district gives us competitive prices on power.

Lake Shipping:—Welland is situated on the Welland Canal, the great marine highway, between tide water and the Canadian North-west, with daily freight service both ways.

Send for booklet that tells the story of Welland from the manufacturer's standpoint.

GRATON & KNIGHT

Standardized Series

LEATHER BELTING

Tanned by us for belting use

GRATON AND KNIGHT

Production is Paramount

INDUSTRIAL production demands Standardization,—Standardization of machinery and machine parts, and Standardization of belting because belting *is* machinery. Buy a belt as you would buy a machine, with *greatest production* the paramount thought.

Graton & Knight Standardized Leather Belts are insuring maximum production in Arsenals, Navy Yards, Munition Plants—everywhere, because they take up all the power, carry all the power and deliver all the power.

There is always one right belt for the job,—you can't afford to take chances with any other. Graton & Knight Standardized Leather Belts are a set of standards which enable you to secure the **one** right belt for every drive, each belt uniform in tannage, quality and performance.

Standardize your belting,—it is the only safe, sane and profitable way with present demands on industrial production.

Let a Graton & Knight representative tell you about Standardization of Belting, particularly about Graton & Knight Standardized Leather Belts.

Complete information cheerfully given and without obligation.

What Counts Save Results?

Embodied in the meaning of that word "Results" are—quality, quantity and the efficiency of the machine. So, when the quality is undoubted, speed is the primal requisite.

This No. 7½, Single Spindle Grinder, is built with unusually large dimensions throughout. The 30″ disc wheel is interchangeable with the 20″ ring wheel chucks. Spindle, 2¾″ diameter and mounted in self-aligning radial and thrust ball bearings. The rocker shaft is 3½″ diameter and supports two Lever Feed Tables. The 9″ face of the pulley gives wonderful driving power.

If you are not acquainted with the Gardner line of Single or Double Spindle Grinders, consider it a pleasure for us to supply you with all the information you desire. Our line is most comprehensive. We maintain a Service Department solely to give valuable service to the trade. Write us. We could help one another.

THE JOHNSON FRICTION CLUTCH

HAS CHANGED POWER TRANSMISSION

The Old Way →

The New Way

"Johnsons" Drive Direct from Line Shafting

JOHNSON Friction Clutches mounted over every machine allows any machine to be stopped or started at the will of the operator while the others are still running. This method eliminates the cross belting from the regular line shaft to the countershafting and consumes a great deal less power. There is only one-half the transmission equipment necessary when the countershafting is eliminated, which means one-half less initial cost, one-half less friction, one-half less trouble and repair, one-half less space occupied, and a cleaner, neater and lighter machine room. Although small in size the Johnson Friction Clutch is designed to drive considerable power at high speeds. It works in a field of its own, as we do not build a clutch to handle more than 50 H.P. at 1,000 R.P.M.

Single Clutch—Interior.

It is the clutch the conservative engineers specify. Let us help you derive clutch satisfaction. We have the clutch for your requirements. Write for our booklet, "Clutches as Applied in Machine Building," and our yellow data sheets.

We have combined convenience, power, rigidity, accuracy and ability to rapidly handle any work within range of this machine. Fitted with slotting attachment, index centers, either stationary or tilting head, vertical milling attachment, etc., the No. 3 is one of the most serviceable small-work machines built.

We make a high grade line of Milling, Drilling and Tapping Machines. Cutting-off Saws, etc.

METALWOOD

TEST PRESSES

Reg. U.S. Pat. Office

For Applying Internal Presses Physical Test to Shells

Hydraulic Testing Machine for applying internal pressure to 75-mm. U.S. Shell.

This Metalwood Hydraulic Testing Machine provides the most convenient and durable apparatus for the internal hydraulic test to which 75-mm. shells must be subjected.

It enables more than two shells per minute to be filled, sealed, brought up to 18,500 lbs. pressure per sq. in. and held at this specified pressure for the required 15 seconds.

From 1,200 to 1,500 shells per 10-hour day are well within this perfected machine's capacity.

It combines with direct and intensified systems of operation based on a constant pressure of 1,500 lbs. per sq. in. in the accumulator reserve line.

You and every Canadian manufacturer of 75-mm. shells can profit by the experience of a number of the largest shell makers in the United States. Assuredly no other method is so simple, so speedy, so altogether efficient.

Write for all particulars about this Metalwood Hydraulic Testing Machine.

For banding 6" to 12" Shells.

Banding Presses

For Pressing in Copper Rotating Bands on Shells

Their sturdy construction allows them to stand up under severe service. This is the reason for their higher price. Such extra care, better material and expert workmanship are required that the results warrant the high cost.

They have six 11" semi-steel rams which move ½" or more if necessary. All rams returned by levers on plates with heavy Vanadium Steel Springs. Cylinder removable of alloy steel.

All fittings dropped forged steel. All parts under strain, alloy steel castings and forgings.

Built also in smaller size of same type for banding "pounder" to 6" shells.

We are Designers and Builders of High Speed Hydraulic and Special Machinery for all Purposes. Complete Hydraulic Installations.

MURCHEY
TAPS AND DIES

PROBABLY you never heard a finer business story than the substantiated facts about Murchey Collapsing Taps, Hand-Sizing Taps and Automatic, Self-Opening Dies—what they have done, are doing, and why. In England, France and Russia, but little less than here at home, they have opened wise eyes to unthought-of possibilities. With their whole story before you—the exact facts in respect to production increases and unmatched economies attained—you will also conclude that Murchey Tools are simply indispensable to absolute accuracy and greatest profits.

Write to-day for your copy.

Adjustable Tap

Handle 75-M/M Shells Just Once

Two Murchey Taps on your lathe completely finish this shell so that when it comes off the machine there is no more handling or re-sizing to do. Therefore

Self-opening Die

By using Murchey Collapsing and Adjustable Taps, you save two minutes or more on every 75-mm. Shell. Figure that in dollars for yourself!

Practically all the large plants of the United States are lining up with Collapsing Taps to thread the nose of this shell. No minute must be knowingly wasted.

Murchey Chasers are quickly adjusted to compensate for wear, and Murchey Adjustable Taps serve as long as ten solid Taps.

Collapsible Tap

Write at once for all particulars.

MATTHEWS DIES AND STAMPS

The Importance of Marking Your Products

CLEAN-CUT characteristic markings give your products that individuality that enables the buyer to recognize them at a glance.

Your firm name and address stamped in a prominent place by MATTHEWS' Marking Devices will be permanently legible.

Serial numbers, part numbers, and drawing numbers enable replacements to be ordered intelligently.

Code numbers recording material lots, workmen, or machines can be used to trace cause of defects due to faulty material, careless workmanship, and inaccurate machining.

Parts can be numbered to facilitate distribution of material to proper departments and to provide quick identification on the assembly floor.

MATTHEWS Marking Devices have been used for years by many prominent concerns who will vouch for their dependability and worth.

A copy of our catalog will acquaint you with the complete line of MATTHEWS stamps, dies, stencils and marking devices.

THE CANADIAN FAIRBANKS-MORSE COMPANY, LIMITED

THE year now closing has been an eventful one in world affairs, nationally, internationally, politically, socially, industrially, and commercially. The grim spectre of war still tarries with us, not only so, but its nature, intensity, and territorial scope give as yet little evidence of having reached their zenith. We in Canada during the past year have had brought home to us more fully than ever before the realization of our part in the gigantic struggle, not in one or a few ways, but in every conceivable direction, and it may well be that in the coming twelve months a still keener sense of our participation will be given practical demonstration.

Intensified War Effort

We have accomplished much during the year to be proud of, although on all points we have not been as united as we might or should have been. In the matter of men for the fighting line, who would uphold not only our national and Empire honor, but step into the gaps left by our sick, wounded, and dead, we have replaced voluntary enlistment by compulsory service, although not a little heartburning is abroad in consequence. That a change had become both necessary and urgent all students of the war situation are unanimously agreed.

Our most outstanding national achievements have been, however, the flotation of a huge domestic Victory Loan and the election to power of a Union Government, with a mandate to utilize every resource of our Dominion in a legitimate manner to help bring the war to a speedy termination.

Importation Difficulties

The entry of the United States into the conflict on the side of the Allies may be reckoned as the big international event of the year, the Russian debacle notwithstanding, and, while inconveniences have arisen as a result of the former, in the matter of materials of construction for metal-working industries, large quantities of which we have always been obliged to import from the States, it must be admitted that the benefits generally accruing to the former Allies, ourselves included, easily offset any disabilities under which we labor meantime, and which may not improbably be removed, just as soon as the American war machine gets properly into action, which is no far-off event.

Ring out, wild bells, to the wild sky,
The flying cloud, the frosty light;
The year is dying in the night;
Ring out, wild bells, and let him die.

Ring out old shapes of foul disease;
Ring out the narrowing lust of gold;
Ring out the thousand wars of old,
Ring in the thousand years of peace.

Machine Tool Activity

The activity in machine tools this year has again been due almost entirely to the munitions industry but business has not been quite so good as it was last year. The reason is easily explained. Last year was an extraordinarily busy one in the machine tool business, because so many shell plants had to be equipped to produce the various sizes of shells then required. For the first three or four months of this year the expenditure on munitions was practically as heavy as during the latter part of 1916, but later on fewer contracts were given out and for some months only about $30,000,000 a month has been expended as against $100,000,000 formerly.

Furthermore, fewer plants have been equipped this year as so much had been done in this direction previously. If, however, a comparison is made with conditions in normal times, the volume of business this year has been remarkably good, more particularly during the first five or six months. Since that time there has been a gradual decline in demand for machine tools for munitions, but an improvement in demand for machinery for general purposes and also for shipbuilding yards.

Shipbuilding Tools

In regard to shipbuilding, the demand for machinery for this industry hardly came up to expectation. For one reason practically all the new yards were established for building wooden ships and existing plants building steel ships did not require much new equipment. The shipbuilding activity, however, has been a source of some business and practically cleaned up the market of a certain class of tool not in demand at the time for any other purpose.

Machine tool builders in Canada have had another satisfactory year, not as good as 1916, but better perhaps than many anticipated. There was a falling off in business during the summer, but recent developments in the trade have considerably improved the outlook and it is not unlikely that next year will be a prosperous one for the industry. Developments in the United States have opened up an opportunity for Canadian firms to take up new lines and specialize more than they have done in the past. If some of our leading concerns embrace this opportunity it should be a lasting benefit to themselves and to the industry generally. All indications point to the increasing difficulty in obtaining machinery from the United States which should be sufficient inducement to develop new lines.

Tools for Shellmaking

Builders of special tools for shell production have had a good year on the whole. During the last five or six months they have not been quite so busy but quite recently business improved and when the new shell contracts are placed they will benefit accordingly. The war has undoubtedly been beneficial to the machine tool industry, apart altogether from the increased business, in that it has been responsible for the development of new machines, and improved methods while workmanship has been correspondingly more accurate. The financial position of the concerns has also been considerably strengthened, enabling them to improve their plants and develop new lines.

Conditions in the United States have a distinct bearing on the situation of the trade in Canada, owing to the number of machine tools of various kinds that have been imported. Prior to the United States entering the war, the situation in regard to deliveries was not particularly satisfactory and prices were decidedly high. Some lines were easier to obtain than others, but as a rule deliveries were backward, particularly on tool room equipment; which was at a premium. Since that time the situation has been growing worse and worse and would have been serious if the demand in Canada had been as heavy as during 1916. As it was, the difficulty in obtaining machine tools was bad

enough, but became worse as the activity in the States increased.

Early in October the Exports Administrative Board at Washington prohibited the exportation of certain tools, except under license, the list issued at the time including vertical boring mills 42-inches and larger; engine lathes with 42 inches swing and larger, and planers 36-inches wide and larger. Since the embargo was put in effect it has become more difficult to obtain licenses even for machinery for munitions plants.

The demand for machine tools of all kinds in the States at the present time is such that practically the entire output is required for domestic use. Early in November the Dominion Government issued an order prohibiting the exportation of plant, machinery, and equipment, of all kinds necessary for the production of munitions, except under license. Needless to say it is practically impossible to obtain a license as the equipment is required in Canada.

For a time previous to this order being issued, as small firms had completed their contracts and the plants were standing idle, the necessity of the export prohibition was obvious particularly in view of fact that the Imperial Munitions Board contemplated placing further orders for shells when necessary financing could be arranged. About this time the American Government distributed orders for 75 m.m. shells among about a dozen of the largest concerns who had been making shrapnel. This helped to keep the ball rolling as some 6-inch shell for the British Government had been given out previously. It is fully expected that early in 1918 the Imperial Munitions Board will place large contracts for 6-inch, 4.5-inch and shrapnel all of which will benefit the machine tool industry as a whole,

Shipbuilding and Marine Engineering Prominent

Shipbuilding and marine engineering as factors in Canadian industrial development and progress have come into the spotlight during the year, both wood and steel vessel construction figuring prominently.

Shell-making, although active, has been less evident compared with the years 1915 and 1916; nevertheless many metal-working plants continue to find a more or less profitable outlet for their operations in that direction.

The completion of the Quebec Bridge in September stamps that structure as one of the world's great engineering achievements, and gives its designers and builders, the St. Lawrence Bridge Co., an honored place in world craftsmanship.

Tragedies of the Year

Tragedy, as might be expected, has not been lacking in our national experience and, in its train, bereavement. Our sick and maimed are being returned from the far-flung battle front in large numbers, and cables on ocean's bottom tell of our sons and brothers who have made the supreme sacrifice. On sea, on land, and in air, lives are being spent both in action and preparatory thereto, which leads us to mention the overwhelming disaster which overtook the City of Halifax in the closing weeks of the year.

From every point of view its occurrence is deeply regrettable, and whether by accident or design, the latter of which we see no reason to credit, such a war-time happening within our borders should be the means of stimulating a closer supervision of the competency of the men entrusted with ship and railroad transportation movements, as indeed of every manner of enterprise likely to menace the life of the individual or cause destruction of valuable property of any kind.

Public Works Curtailed

Public works have featured the year's activities little, expenditures of that nature being almost wholly eliminated. Among the prominent enterprises discontinued for the period of the war at least are those of the new Welland Canal and the Hudson Bay Railway and Terminal at Le Pas, Man. Dock and harbor work has been cut down to the irreducible minimum, and in some cases suspended altogether. Railroad transportation facilities, improvement and enlargement, and manufacturing plant extensions have been conspicuously absent, aside from those required for carrying out the munitions or shipbuilding programmes.

Iron, steel and metals have as usual a special department in this issue, the charts and accompanying text matter demonstrating the price movements of the more generally used commodities entering into machine and general engineering construction.

Season of Navigation

The season of navigation on our lakes, rivers, and ocean shores has again been a profitable one, both as to passengers and freight carried. More Great Lakes vessels have been transferred to ocean and ocean coast trade. The high freight rates prevailing, due to deep sea tonnage shortage, have, of course, made the transfer easily worth while, the added risks notwithstanding.

Steel and wood vessel construction, also marine propelling and auxiliary engine building are featured in another department of this issue, sufficient, therefore, to note here that the twin industries of shipbuilding and marine engineering have at no time in Canada's history been so active, nor has the immediate and future outlook warranted an equal measure of optimism.

Power development, municipal enterprise and building may be said to warrant their activities again being classed as well below normal. Munitions production and shipbuilding during the year have continued to make large demands on available sources of power supply, and perhaps in Ontario more than in any other province of the Dominion has the electrical energy procurable become dangerously inadequate. Development of water power resources is, however, being steadily prosecuted, and expectations are that before the winter of 1918 is upon us a reserve of hydro-electric power will again be registered.

Labor Market

The labor situation has been more or less acute all year, and will not, while the war lasts, show any large measure of easement. Skilled labor shortage is perhaps most keenly felt in the spheres of shipbuilding and marine engineering, for while unskilled male and female help have been successfully requisitioned in munitions making, neither have as yet shown aptitude to tackle the work of relieving the shipping shortage.

The value of the telephone to commerce and industry was given formal appreciation on October 24 of this year, when a memorial was unveiled at Brantford, Ont., by His Excellency the Duke of Devonshire, Governor-General of Canada, to commemorate the invention of the instrument in that city by Dr. Alexander Graham Bell in 1874. The venerable gentleman, we are pleased to say, was present and participated in the interesting function.

Considering the prevailing shortage of "bottoms," a considerable export business has been done by many Canadian manufacturers, the commodities ranging all the way up to such weighty units as railroad box cars and locomotives.

Shipbuilding in Reinforced Concrete

Shipbuilding in reinforced concrete has been undertaken on a moderate scale in Montreal during the year, a small steam-driven vessel having been constructed and launched there. The shortage of shipping has stimulated activity in this direction, and while the effort has been restricted for the most part to craft of the barge type for canal and river service, there is little doubt that, with the prolongation of the war and the continuance of the submarine menace, some attempt will be made to create a class of vessel more akin to that of the well-known standard steel ocean-going freighter.

Fuel Shortage

A shortage of fuel for both domestic and manufacturing purposes has prevailed all through the year, and in these closing weeks the situation has developed an acuteness amounting almost to a menace. Canada is largely dependent on the United States for its fuel supply, hence she suffers from the restrictions placed on the shipment of coal between points in the two countries. A pleasing feature of the situation, however, is the fact that we are not being discriminated against in any way; as a consequence, just as soon as the congestion on American railroads can be relieved we may hope to receive again the fullest service possible.

The United States is giving every indication of its willingness to meet Canada at least half-way as regards international business relations, and we, through responsible Government at Ottawa, should be at once willing and anxious to do likewise.

Aero-Plane Construction in Canada

Our Newest Industry

Staff Article

That aeroplane building in Canada has reached a stage which entitles it to be considered a staple industry will be evident to the reader of the following article. It is indeed a tribute to the manufacturing ability of Canadians that under circumstances of great urgency they should have undertaken successfully the manufacture of such widely varying items as shells, ships and skyboats.

DESPITE the paucity of official bulletins and communications on the subject of aviators' work at the front, sufficient facts have filtered through to show that Canadian recruits receive a high valuation from the Imperial authorities in regard to the peculiar qualifications necessary for successful work in this branch of the service. Coolness, daring, intrepidity, physical fitness and courage are amongst the essential requirements.

Canada a Training Ground

While the final stages of training and instruction preparatory to actual participation in fighting must, in the nature of things, be received as near the scene of hostilities as convenient, it has been possible and in some respects desirable to impart the rudiments and groundwork of flying in the native land of the aviator. Nature has so favored Canada as a training ground that not only are her own sons trained in large numbers, but during the past year large numbers of United States aviators sojourned at the different camps here, the proximity of the two countries rendering any change of venue comparatively void of influence on the final quality of material turned out.

The desirability of producing machines as well as men in this country was recognized some time ago, public interest in the matter being stimulated by the occasional donation of machines by individuals, localities or towns. That aeroplane building in Canada has reached a stage which entitles it to be considered as a staple industry will be evident to the reader from the photographs reproduced herewith.

Naturally Favored

While our Southern neighbor has had considerable advantage in the matter of material and manufacturing resources with regard to the building of engines and mechanical accessories, the all important problems of wood and fabric supplies are more satisfactorily met with home products. When to this is added the experience being gained by hundreds of workers, and the problems which have had to be solved by the different organizations employed, the certainty of the Dominion enhancing its reputation as an aviator's land in the future seems more than assured.

It is indeed a tribute to the manufacturing versatility and ability of Canadians that, possessed of limited knowledge and resources a few short years ago, they should have successfully undertaken, under circumstances of great urgency, such widely varying items as shells, ships and skyboats. And yet a visit to a typical aeroplane factory reveals nothing mysterious in the way of methods and devices; rather does one find an industry into which the best of several others has been gathered—men, machines and minds—all directing their efforts to perfection in design and manufacture as in few other industries.

Plant Personnel

Metallurgists and chemists — toolmakers, machinists, pressworkers—welders and heat treaters—lumber experts, woodworkers, assemblers — seamstresses, fabric workers, varnishers—all these expert operators, many of them women, are engaged in the newest and most interesting industry.

Safety, so far as it is humanly possible to insure such under circumstances, is the first consideration, and the visitor to an aeroplane factory is, therefore, not surprised at the extreme

AEROPLANE FUSELAGE IN COURSE OF FINAL ASSEMBLY. CONTROL WIRES BEING CONNECTED UP AND BODY AND ENGINE DETAILS COMPLETED.

plant in operation. I believe, however, that as time goes on this question will automatically settle itself.

I feel that the coming year is bound to be one of general industrial activity and prosperity.

BANK PRESIDENT'S VIEWPOINT

By Sir Vincent Meredith.

BUSINESS conditions in Canada continue buoyant. There is no recession in the great wave of industrial and commercial activity of the past few years, and trade in all lines, including what are generally known as luxuries, is highly prosperous. There is little or no movement in real estate, and building operations are restricted. Labor is fully employed at high wages, and there continues to be a deficiency in the supply.

In the ten-year period, 1905 to 1915, the amount of capital employed in manufacturing industries in Canada increased from $846,585,000 to $1,994,103,000, or by 135 per cent., while the value of the products of these establishments rose from $718,352,000 to $1,407,000,000, a gain of 96 per cent. The output of munition plants has doubtless been a factor, though it is obvious that the industries of Canada are steadily enlarging the volume of their business and finding new markets.

The Readjustment Period

I am hopeful of prosperous business conditions being continued for some time during the readjustment period following the war. In this connection the desirability of the extension of Canadian trade in all directions during the period of post-bellum reconstruction, either through commercial intelligence agents, acting directly for the Government or a board approved by the Government, should not be lost sight of.

No one can tell how long the war will last. The imperative need, therefore, for efficiency and increased production, together with economies in all public and private expenditure is obvious and cannot be repeated too often or urged too strongly.

The unbounded prosperity of Canada, referred to a year ago, is fully reflected by the abnormal trade figures. In the seven months to October 31 last the aggregate value of imports and exports was $1,586,616,000, or $273,000,000 more than in the corresponding period of the preceding year. Eliminating the item of coin and bullion, as well as that of foreign produce in transit through Canada, our foreign trade was $1,550,000,000 for the period as compared with $1,084,000 last year, an increase of 50 per cent.

Our country is one of the most productive in the world. Our gold holdings per capita almost equal those of the United States. Our natural resources are unbounded and our credit is irreproachable. There are no doubt difficulties and anxieties ahead which we shall still have to face, but I think we may look forward with confidence to providing without undue strain for the burden of our patriotic endeavor.

BANK MANAGER'S VIEWPOINT

By Sir Frederick Williams-Taylor.

ABOVE all other events the entry of the United States of America into the war stands paramount and bears upon the Canadian economic and banking position with a force the effect of which is only now commencing to be felt.

Shortly after the outbreak of war Wall Street, as every one knows, took the place of the London market for our country's public loans, and continued in that place until a few months ago. Now the influx of American capital is scanty, the inflow of borrowed money from the United States—which we had come to look upon as a matter of course—is suspended, it may be until the end of the war, and Canada is "on her own."

Canada On Her Own Resources

In other words, little money is coming into Canada except in payment of exports, and, therefore, for the first time since Confederation the Dominion is cast upon her own financial resources. By some this will be regarded too seriously, by others not seriously enough. Actually, the stoppage will have far-reaching consequences. On the one hand, industrial development will be checked, but on the other hand the inability to borrow may prove a blessing in disguise, once we have adjusted our affairs to the changed conditions.

It is surely well for us to learn to do without financial assistance, especially as the country at large already has a debt abroad, the interest on which runs into the great sum of about $500,000 per day. So long as the stream of money flowing into the country was uninterrupted it was difficult, if not impossible, for our people to see the necessity for economy. Personal extravagance is still conspicuous in many directions, but presently economy will become general—from high motives, we hope; if not, then from stern necessity.

Borrowings Necessary for Development

The development of Canada could never have reached its present stage but for moneys borrowed abroad, and, therefore, Canada is grateful, first, to Great Britain, and, secondly, to the United States, for the help they have thus contributed to the remarkable progress which our country has made, particularly during the past twenty years.

Our misuse of borrowed money is in great measure responsible for some of the chief evils that have come upon us. I refer especially to the inflation which before the war started the increase in the cost of living, and to the creation of debt unrepresented by productive investment. Now that the inflow of money is suspended we must pull ourselves together, practise economy, till the soil, produce to a greater extent the manufactured goods we require for our own use, until in the fullness of time we emerge a wiser and a better people in a sounder economic position.

Having learned our lesson, this is clearly no time for us to brood over the errors of the past score of years, but rather to take stock of our resources, and with stout hearts to set about the work of conservation and rehabilitation. We are the fortunate possessors of a splendid, healthful and beautiful country, abounding in natural wealth; and, what is equally important, we can properly claim to be a virile, industrious and ambitious people.

PROGRESS IN DRY DOCKS AND MARINE RAILWAYS

DURING the past two decades there has been great progress made in the engineering of dry docks, and particularly in the three general types, the graving or basin dry dock, floating dry dock, and the marine railway. In the first of these, with the exception of the introduction of modern electric motors, their operation is practically the same. This device has been a welcome addition to the pumping equipment. Another improvement is the adoption of the bilge block system of supporting vessels, which had its first real impetus in 1892, when the United States Government adopted the system of equipping battleships with docking keels under the bilges for supporting the ship by this means instead of relying on side shores. So far as the size of these docks is concerned, they are being built to-day from 1,000 to 1,200 feet long, where a score of years ago a 600-foot dock was considered a large one.

All-Steel Floating Dry Docks

In 1897 the Clark & Stanfield Co. had built a 10-000-ton all-steel floating dry dock at Havana, Cuba, which was considered the last word in that type. In 1900 the first all-steel floating dry dock in America was built. This was of the Clark & Stanfield type, and its capacity was 18,000 tons. It was constructed for the United States Government. Great Britain has adopted floating dry docks for her larger war vessels, having installed two such of 32,000 tons capacity each at its most important naval stations. The German Government has an even larger floating dry dock at Kiel, the capacity of which is 40,000 tons, while at Hamburg there is one of 35,000 tons. The largest floating dry dock in America has a lifting capacity of 25,000 tons.

Marine Railways

During the past twenty years the marine railway has also come into prominence, and while there were marine railways previous to 1896 they were of a crude type, both in Europe and in this country. The type that has been most highly developed in this and other countries is the Crandall railway, named for its originator. In 1896 there were three of these railways in the United States of from 1,200 to 2,000 tons capacity and two in Canada of 2,500 tons, in addition to a number of smaller ones. In 1900 a 4,000-ton Crandal railway was built, and now there are many with a capacity of from 3,000 to 5,000 tons. In the latter type, equipped with modern electric machinery, it is possible to pick up a 5,000-ton vessel practically as she floats in the water and haul her out in less than half an hour.

Obituary Record of Canadian Business and Public Men

The year 1917 bears away on its bosom at least its fair share of our business and public men—young and old, although due to the sacrifice exacted by war service, we are perhaps poorer than otherwise, especially as regards the former. Whatever the circumstances, the record of their passing to the Shadow-Land merits specific reference being made to their place and part in the upbuilding of our national fabric, industrial and otherwise.

James P. Wood, a member of the firm of Wood Bros., foundry, died at Chatham, Ont., on March 16, aged 45.

Capt. William Matthews, a well-known mariner of the Great Lakes, died at Cobourg, Ont., on July 17, aged 69.

William Sherman Smith, harbor master at Dalhousie, N.B., for over twenty years, died on January 4, aged 65.

Thomas J. Gerry who for over twenty-five years was connected with the Dodge Manufacturing Co., Toronto, as traveller died at his home there early in April.

Frank Paul, founder of the Belding, Paul Co., Montreal, now known as the Belding-Paul-Corticelli Co., silk manufacturers, died on Jan. 23, aged 70.

Martin N. Todd, president of the G. P. and H. Railway and general manager of the L. E. & N. Railway, died suddenly at his home in Galt, Ont., on Aug. 29, aged 58.

Lieut. Hugh A. Kennedy, eldest son of Colin R. Kennedy, vice-president and manager of the A. R. Williams Machinery Co., of Vancouver, was killed in action in France on Nov. 16.

John Grundy, engineer at the works of the Canada Carriage Co., Brockville, Ont., was accidentally killed on Jan. 1. in the performance of his duties. Deceased was 65 years of age.

George Forest McKay died at New Glasgow, N.S., on March 13, at the age of 82 years. Mr. McKay assisted in the founding of the Nova Scotia Steel & Coal Co., and was its oldest director.

O. M. Hennessy, manager of the Abitibi Pulp and Paper Co., was drowned in July in the Couchiching Rapids, near Lake Abitibi. He was appointed manager of the company six years ago when that concern was organized.

Capt. Joseph A. Tymon, one of the best known of inland water sailors, and for many years commander of a Toronto Ferry Co. steamer, passed away on June 5 at his residence, 227 Logan Avenue, Toronto, aged 50.

Corp. Robert John Dawson, of the P.P.C.L.I., was killed in action in March. He went overseas with the 3rd University Company. Prior to enlisting he was salesman for the Canadian Fairbanks-Morse Co., Front Street, Toronto.

J. A. Sanderson, a prominent business man of Brantford, Ont., died at his home in that town on March 14. The deceased was 60 years of age. He was president of the Brantford Carriage Co., and a director of the Cockshutt Plow Co.

Capt. James Murray, one of the oldest captains on the lakes, passed away on February 21, at Clayton, N.Y. The deceased was born in Ireland, but came to Canada at an early age and went into the marine business. For many years he was known in marine circles as one of the most capable officers of the Montreal Transportation Co.

William Lyon Mackenzie, bridge engineer of the C.N.R., died at his home in Winnipeg on Feb. 8, at the age of 57 years. Mr. Mackenzie formerly was connected with the C.P.R. and Grand Trunk Railways.

Thomas Peck, president of the Peck Rolling Mills, Montreal, died at Kennebunk Beach, Me., on Sept. 5, aged 75. Mr. Peck had been associated with the steel business all his life and had been president of the concern for the last five years.

Capt. David Sylvester, well known on the Great Lakes, died in Toronto on July 18. Capt. Sylvester was born in Scarborough, Ont., in 1838. For some years he conducted a commission and brokerage business at Church Street Wharf, Toronto.

Capt. Henry Oldenburg, who for almost half a century had sailed the waters of Detroit River, and for the past twenty years has been in command of the Grand Trunk car ferry, Lansdowne, died at his home in Windsor, Ont., on September 4, aged 68.

Major Gordon D. Powis, at one time representative of the Canadian Westinghouse Co., at Edmonton, was killed in action, in November. Major (then Captain) Powis went overseas in April, 1916, with the 63rd Battalion but was later transferred to another unit.

Hugh Russel, a life-long resident of Montreal, died on March 22 at his residence, 423 Guy Street, there. Mr. Russel was president of Hugh Russel & Sons, Ltd., iron and steel merchants, Place d'Armes, and had been in business for himself since 1868. He was born in Montreal on August 17, 1844.

Fred S. Henning, who was superintendent of the Island filtration plant, Toronto, for a number of years died in July in Toronto after a long illness. Mr. Henning was born at St. Catharines, Ont., in 1856 and was at one time Grand President of the Canadian Marine Engineers' Association.

Lieut.-Col. Wood Leonard, D.S.O., of London, Ont., was killed in action last March, in France, while in command of the 3rd Artillery Brigade. Col. Leonard was associated with his father and brothers in the firm of Leonard & Sons, London, Ont. He was a graduate of the Royal Military College, Kingston, Ont., and went overseas in 1914 in command of the 6th Field Battery. Col. Leonard was 34 years of age.

Hugh McCulloch, one of Galt's most prominent residents, died there on January 8, in his sixty-first year. He was president of the Goldie & McCulloch Co., vice-president of the Galt Malleable Iron Co., and of the Galt Art Metal Co., and a director of the Gore Mutual Fire Insurance Co.

Almond Penfield Turner, formerly president of the Canadian Copper Co., a subsidiary of the International Nickel Co., died on May 18 in Oakville, Ont., at the age of fifty-two. The late Mr. Turner spent most of his life in Cleveland, but was in Copper Cliff, Ont., for ten years, with the Canadian Copper Co., joining same in a junior position and rising to the presidency.

J. H. Welsford, president of the Union Steamship Co., of British Columbia, died in May at his home in Liverpool, England. Mr. Welsford was a prominent shipowner in Great Britain, but frequently visited British Columbia. He purchased a controlling interest in the Union Steamship Co. in 1911.

James Pender, for the past twenty-five years managing director of James Pender & Co., St. John, N.B., nail and wire manufacturers, died on May 30. The late James Pender had a long connection with the trade, having commenced his business career fifty-one years ago as a clerk with T. McAvity & Sons, of St. John.

John Ross, general superintendent of the mill of the Abitibi Power & Paper Co., at Iroquois Falls, Ont., was caught in the transmission and instantly killed at the plant early in December. Mr. Ross was one of the highest paid paper experts in America and had been employed at the Abitibi about one year. He was forty-two years of age.

S. R. Sheldon, vice-president and chief engineer of Sheldon's Ltd., Galt, Ont., the well known manufacturers of heating and ventilating equipment, died on May 7, aged 40. Mr. Sheldon was originally with the McEachren Ventilating Co. and about fifteen years ago took over the business with his brother, W. O. Sheldon. The company was at a later date incorporated as Sheldons Ltd.

Capt. Gilbert Johnston, a well-known figure on the St. Lawrence and the Great Lakes, and long activity connected with the Richelieu & Ontario Navigation Co. and the Canada Steamship Lines, Ltd., died at his residence in Montreal on March 13, after a long illness. Captain Johnston was of Scottish ancestry and was born in Kingston, Ont., sixty-four years ago, being a son of the late Gilbert Johnston. In 1894 he was appointed mechanical superintendent for the

Richelieu & Ontario Navigation Co., a position which he filled with conspicuous success.

Frank Gilbert a well known engineer died at his home in Montreal on Jan. 23, after a long illness. Mr. Gilbert was born in Montreal in 1847. After graduating at McGill University, he started in 1870 in the foundry business, later joining the firm of E. E. Gilbert & Sons, engineers and contractors. Mr. Gilbert founded the old Canadian Engine Works

James Spelman, president of the John S. Metcalf Co., grain elevator engineers and builders of Montreal, London, Chicago and Melbourne, died at his home, Westmount, Que., on May 27. Born at Ottawa, Ont., December 10, 1860, he was employed for some time on C.P.R. construction work in the West and later was associated with the Metcalf Company for twenty years. He was president for the past five of these.

Henry A. Sverett, at one time a prominent street railway magnate of Cleveland, O., died at Pasadena, Cal., on April 11, aged 60. He was formerly president of the Cleveland Railway Co., the Toledo Railways & Light Co., and London Street Railway Co., London, Ont., electrical engineer of the Montreal Street Railway, and was financially interested in many electric traction companies in Canada and United States.

Capt. Arthur J. Latornell, B.A.Sc., at one time city engineer of Edmonton, Alta., died early in December of wounds received in action in France. Capt. Latornell, a Huguenot by descent, was born in Meaford, Ont. After graduating with honors in civil engineering, Capt. Latornell became city engineer of Edmonton, an appointment which he gave up early in 1916 to qualify for an overseas commission.

Lieut. Commander J. A. M. Murray, one of the C.P.R. fleet captains, was instantly killed in the explosion at Halifax. Capt. Murray was for about 15 years in the Elder-Dempster West African trade, and also in the West India line. When the C.P.R. took over the Elder-Dempster line, Captain Murray went with the ships and served under the C.P.R. until four years ago, when he became Harbor Master of Quebec. Last summer he returned to Halifax to join in the Imperial Service.

Dr. David H. Browne, widely known throughout the United States and Canada as a metallurgist of note, died at his home in Montclair, N.J., on March 30. He was 52 years old. In 1891 he joined the forces of the newly-organized Canadian Copper Co., and it was in the service of this concern that he brought about great improvement in the refining of metals and added much to the knowledge of metallurgy in this country.

Robert Weir, president and director of J. & R. Weir, Ltd., Montreal, marine engineers, boilermakers and machinists, died on Oct. 8, at the Western Hospital, Montreal. He was in his 72nd year, and had been a resident of Montreal for forty-six years. Mr. Weir was born in Glasgow, Scotland, in 1846, and came to Montreal in 1871. With his brother J. C. Weir he established a marine engineering and machinist business. In 1875 they formed the partnership of J. & R. Weir, which later expanded and became J. & R. Weir, Ltd.

James Fulton Cummings, a pioneer electrical engineer, who for many years was associated with the interests controlled by Thomas A. Edison, died on July 27, at Long Beach, N.Y. Mr. Cummings, who was born in London, Ont., 48 years ago, installed the first electric light stations in Philadelphia, Cincinnati and a number of other cities.

John J. Drummond, of Midland. Ont., died at the home of his brother, George E. Drummond, in Montreal, on April 7. Mr. Drummond was long identified with the development of the iron and steel industry in Canada. He was president of the Zenith Machine Co., Midland, Ont. The deceased was born in the North of Ireland in 1856 and came to Canada at an early age.

John Taylor, founder of the firm of Taylor & Arnold, Ltd., general railway supplies, died on Dec. 19 at the residence of Thomas Arnold, Montrose Avenue, Westmount. He was born at Ayr, Scotland, March 18, 1833. He came to Canada in 1837, and had resided in Montreal ever since. At one time he was a member of the firm of Moreland, Watson & Co., which organized the Rolling Mills, now part of The Street Co. of Canada. He was one of the organizers of the Royal Montreal Golf Club in 1876, and was the first Captain and gold medalist, and one of the best-known golfers in Canada.

Sir Lyman Melvin Jones, president of the Massey-Harris Co., died in Toronto, on April 16. The late Sir Lyman was a native of York County, and was born in 1843. In 1879 he was sent to Winnipeg as Western manager of the A. Harris Son & Co., Brantford, and later was made general manager. The formation of the Massey-Harris Co. in 1891 brought him to Toronto as general manager of the consolidation. He became president in 1902, and held that post until his death. He was also president of the Bain Wagon Co., Woodstock, Ont., and the Johnston Harvester Co., Batavia, N.Y.

Joseph Hobson, noted civil engineer, died at Hamilton, Ont. Mr. Hobson was born near Guelph, Ont., in 1833, and was educated professionally in Toronto. Whilst still a young man, he joined the firm of contractors that built the section of the main line of the Grand Trunk Railway from Toronto to Guelph. In 1870 he was appointed bridge engineer of the southern division, formerly the Great Western Railway, and in that capacity he had charge of the construction of the international bridge from Buffalo to Fort Erie, and of the replacement of the old Suspension Bridge below the Falls of Niagara. For ten years he held the position of Chief Engineer of the Grand Trunk Railway System, from 1896 to 1907; since which latter date he had been consulting engineer. Two of his great achievements were the construction of the St. Clair tunnel and the rebuilding of the Victoria Bridge at Montreal.

CANADIAN LOCOMOTIVE CO. YEAR

THE Canadian Locomotive Co., Kingston, Ont., have completed and shipped during 1917 a total of 108 steam locomotives, of which 40 were to the orders of the British Government and the remainder for domestic service. The plant has enjoyed possibly the most prosperous year in its history, munitions production entering into the activities as well as that of locomotives. The outlook for the coming year is bright and will in all probability eclipse the present twelve months' record. A list of locomotive orders received during 1917 follows, also a detail of the shipments made.

Name of Railroad or Company	No.	Type	Dimen. of Cylin.	Wgt. Eng. in Working Order	Max. Trac. Pow.
T., H. & B. Ry.	4	060	21"x28"	165,000	37,000
G. T. Ry.	10	282	27"x30"	284,800	51,625
Can. Gov. Rys.	50	282	27"x30"	278,000	53,100
T., H. & B. Ry.	6	060	21"x28"	165,000	37,000
Locomotives Shipped During 1917 by Canadian Locomotive Company, Limited					
Can. Gov. Rys.	37	282	27"x30"	277,500	53,100
Mnville Asb. Co.	2	060 T	18"x24"	116,285	27,040
British Gov.	40	280	21"x28"	159,000	37,400
T., H. & B. Ry.	4	060	21"x28"	165,000	37,000
G. T. Ry.	10	282	27"x30"	284,800	51,625
Can. Gov. Rys.	15	282	27"x30"	278,000	53,100

Dependence on U.S. Coal.—The total coal production of Canada in 1916 was 14,500,000 tons, while the imports were 17,500,000 tons. This shows our dependence on the United States and the necessity for retaining public control of waterpowers.

INDUSTRIAL NOTABILITIES

CHESTER B. HAMILTON, Jr., mechanical engineer, proprietor Hamilton Gear & Machine Co., Toronto, Ont., was born in that city, April 8, 1884, son of Chester B. Hamilton and Anna (Van Wagner), Hamilton, and is of old United Empire Loyalist stock.

Mr. Hamilton received preparatory education at the Provincial Model School and Jarvis Street Collegiate. Mr. Hamilton attended the University of Toronto, graduating from the School of Practical Science with the degree of B.A.Sc.

After a number of years of general engineering experience over a fairly broad field Mr. Hamilton started in business on his own account in 1911 and devoted his efforts

CHESTER B. HAMILTON, Jr.

entirely to the manufacture of machine cut gears, this work, however, having been considerably supplemented by the production of munitions, gauges and allied war products. Actual experience as a practical mechanic has further qualified Mr. Hamilton to carry on successfully the highly specialized line of work undertaken by his firm.

His interest in technical affairs is evidenced by his society activities—member American Society of Mechanical Engineers, being secretary of Ontario Section of same; associate member American Institute of Electrical Engineers; member (Mechanical Engineering representative) of Joint Committee of Technical Organizations (Ontario branch). He is also a member of the Engineers' Club, Toronto.

Mr. Hamilton is Independent in his political views, and is an Anglican. His residence address is 43 Madison Ave., Toronto, Ont.

PUBLISHERS OF

CANADIAN MACHINERY AND MANUFACTURING NEWS

A weekly newspaper devoted to the machinery and manufacturing interests.

PETER BAIN, M.E., Editor. B. G. NEWTON, Manager.

Associate Editors
A. G. WEBSTER J. M. WILSON J. H. RODGERS A. V. BURR

Office of Publication, 148-153 University Avenue, Toronto, Ont.

Vol. XVIII. DECEMBER 27, 1917 No. 26

THE SEASON'S GREETINGS

TO the subscribers to and advertisers in CANADIAN MACHINERY we, as its publishers, extend heartiest Christmas Greetings, and express the hope that the New Year on which we are about to enter may not only bring "Grist to the Mill" as has its immediate predecessors, but usher in that era of peace and goodwill overdue, yet so much desired, in both a national and international relationship sense. Canadian manufacturers look to the future hopefully, the attitude being based on a new and proved conception of their capacity not only to procure business but to turn out products in variety and type world competitive as and when offering.

FINANCE AND INDUSTRY

THE reports of the Canadian banks now coming to hand indicate the great extent to which our financial machinery has been devoted to national operations during the year. In practically all the statements thus far made public the outstanding feature has been the increase in the holding of securities of the Canadian and British Governments; in some cases as high as one-third of the bank's total assets are evidently thus represented. However, this national financing has been accomplished without materially reducing the funds available for commercial and industrial purposes although credits for stock operations have been curtailed. Generally speaking, the Government investments are a counterbalance of the increased deposits, indicating in a small circle the effect of war purchases on the funds of the people.

It should be pointed out in regard to the holdings of Government securities that the statements referred to were for a period ending when the Government advances were approaching their maximum. There will in the near future be an important readjustment through the funds raised by the Victory Loan. So far as the position of the banks is concerned, the statements to the end of November indicate materially increased profits and strengthened liquid position, a satisfactory reflection of operations in national finance.

As a result of the success of the Victory Loan, industrial activity will be stimulated, particularly in the direction of provision of the means to prosecute that feature of the war which hinges on munitions and shipbuilding, in which respect, as a nation we are possibly in a much more favorable position than at any time since hostilities began. The close co-operation of finance and industry is indispensable to our development and progress, and 'twould appear that the war, notwithstanding its many otherwise disagreeable features, has contributed to a more pronounced unity of purpose than had previously been apparent.

AT DUTY'S CALL

THE approaching call to the colors of the men enrolled under the Military Service Act will bring to both employers and employees a more intense personal appreciation of affairs than has hitherto seemed possible or probable.

That machinists as a class have voluntarily contributed their quota to all branches of the service is appreciated by all; if any class of workman had a right to claim indispensability for his services, surely the munitions worker, shipbuilder and general engineering employee had as good a right as any. Judging a man's skill by standards obtaining in other countries it is not unreasonable to expect that the majority of workmen whose skill renders them indispensable have passed the upper limit of the present class of recruits, and this hypothesis would seem to account for the refusal of many exemption claims. In fine arts and music there have appeared occasional stars whose phenomenal accomplishments put them, while still young, so far above their elder contemporaries that they really were irreplaceable. These cases, however, are altogether exceptional and are based on a natural enthusiasm and inspiration operating in a field where unrestrained vent can be given to the emotions.

Such conditions do not obtain in engineering circles, and the budding genius who thinks he has a message to deliver in the way of demonstrating his accomplishments very soon finds himself dispensed with. In straight manufacturing work the active energetic producer can, by the aid of suitable machines and women operators, be dispensed with if necessary, but the machinist of mature years, who has worked as toolmaker, draftsman, and frequently foreman or superintendent possesses a higher degree of appreciation of all that is involved in the production of accurate machine work on economical lines. He has lived long enough to have made a few mistakes; if he is wise he has remembered them and profited thereby; if not, he would not hold his present job. Such men as these are the real backbone and mainstay of firms.

It must be admitted that the question of depleting the machinists' ranks of men who under normal conditions would be the next generation of wiseacres is greatly to be regretted, yet why should we as a nation, and machinists as a class wish to act less nobly than others. The fighting spirit of the Welsh coal miners caused so many of them to enlist during the early stages of the war that the coal industry was imperilled to a degree that threatened the safety of the Empire. Can we say that such a state would begin to be reached if every physically fit machinist in Canada between twenty and thirty-four years of age were to cease work? The requirement of physically fitness puts an entirely different aspect on the case, and many physicall unfit machinists possess a very high degree of manual skill and technical training sufficient to carry on.

We have to thank the various corporations and other interests represented in this issue for the privileges of securing information relative to their plants, and for such illustrations a sappear through their courtesy.

Our War-Created Opportunities and Responsibilities

Contributed and Selected

Being expressions of opinion from men prominent in the administration and management of iron, steel and associated enterprises regarding development in trade, commerce, agriculture, manufacturing, etc., during 1917, and their bearing on the immediate and more remote future outlook relative to our Dominion. Optimism will be found predominant.

THE MACHINE TOOL VIEWPOINT

By Sir Alexander Bertram

THE future is always of more interest than the present, and it is the future of the Dominion of Canada which absorbs the attention of manufacturers and financial men in our country. This colossal war must end some time. Wartime activities have taught us methods and means of development. Both our agricultural and our natural resources have undergone intensive stimulation. Land speculation and stock gambling are at a standstill.

Prior to the outbreak of war the stagnant trade conditions caused a great deal of anxiety. Foreign competition took advantage of our initiative in developing export trade and with the aid of cheap labor and cheaper materials, robbed us of the fruits. Since 1914 our natural resources have been uncovered. We knew they were there. We have been compelled to learn efficiency in their development. More than a billion dollars worth of munitions have been made in Canada and sold. The profits from this war industry has placed our factories upon a sound financial basis. Now, is Canada's time and opportunity to prepare for the great reconstruction period which must follow when the world regains its ideals of humanity and civilization.

Make Optimism Practical

In our production of munitions, it has been proven that Canadian manufacturers have excelled themselves in producing materials at a low rate of cost in close competition with other countries. Taking full advantage of present prosperity by improving all equipment, by introducing efficient methods of shop handling, by cutting the time in detail operations, our manufacturers can place themselves in a position to compete with the world. The spirit of optimism now prevailing throughout the country must be brought to a practical basis. We must right away cultivate ways and means.

Canada's Natural Resources

Think of Canada with its illimitable resources, its vast deposits of coal and iron, copper and lead, and yet before the war, we imported from foreign countries half our whole domestic consumption. We were always bringing coals to Newcastle. Even to-day we are importing large quantities of our raw material, products which are dormant in our own country. Again, think of this; forty per cent. of the available water power of the world is in Canada. We have sufficient white coal to drive all the factories of Europe. Canada has long stood at the threshold. She has now opened the door and entered.

Business is war. Clean up your old guns and stand ready to go over the top when the Angel of Peace returns to earth.

THE WAR EFFORT OF THE CANADIAN UNIVERSITIES

By Sir Robert A. Falconer.

DURING the war the Canadian universities have thrown themselves with great energy into a variety of efforts. Of graduates and undergraduates of Canadian universities over 14,000 have already enlisted, of whom some 6,000 are undergraduates. More than 800 have fallen. The distribution of these enlistments covers East and West, the new universities of the West having risen nobly to the call for men. Distinctions have come in large numbers to university men, both in the way of high commands and of rewards for special service. The university man has made an excellent officer, but there are thousands of graduates and undergraduates in the ranks, as might be expected in a democracy such as that of the Dominion of Canada.

Staff Members on Active Service

Large numbers from the staffs of the universities have gone on active service, and many of them are employed in giving instruction. Special work also has been carried through, for which the universities were particularly well equipped. This is especially manifest in the Faculties of Medicine. At least six of the universities have sent larger or smaller hospitals, manned for the most part by their own staffs or graduates, and given additional support to that which is provided by the Government, through the generosity of friends. Some of the smaller universities have sent field ambulances. The record of this medical service has been particularly fine, not only in the character of the work done in the hospitals for wounded and sick soldiers, but also in the scientific results that have been accomplished by certain members of the staffs.

In the laboratories of the universities war work has been conducted for the Imperial and Dominion Governments. Investigations have been conducted in regard to munitions, explosives, and chemical possibilities. Antitetanus, typhoid and other sera have been prepared in the university laboratories, securing for the Canadian soldier good material and for the Government a great reduction in price.

Buildings in Military Service

Many buildings in the different universities have been set aside for military purposes, as hospitals or barracks, or as in the University of Toronto, for the Royal Flying Corps. The spaces around the universities have been turned into drilling grounds.

Members of the staffs of the universities have by lecturing and by writing done a great deal to explain the meaning of the war to their constituencies, and by this means, as well as by the advocacy of the students who have enlisted, the universities have powerfully moulded opinion with regard to the war throughout the country.

STEEL MILL VIEWPOINT

By W. M. Currie.

THE problems confronting Canadian steel manufacturers were never so perplexing and difficult to solve as at the present time. During the past year all steel plants have operated to capacity and I can see no let up in sight for the coming year. The plants capable of turning out steel for munitions have been kept almost exclusively occupied with that class of business, with the result that other plants have been taxed to capacity to take care of the ordinary trade requirements.

In addition to the domestic market, export trade, both to Europe and the Orient, has been excellent. Prospects for this latter class of business are, however, very uncertain, owing to the shortage of ships on the Atlantic and the unsettled condition of the market in the Orient. With further reference to the export trade, while it has been profitable during the last few years, I feel that it is one which cannot be held to any large extent in normal times and that every effort should be made to take care of the home market.

During the past year we, along with every other industry, have experienced a labor shortage, but have always managed to get sufficient to keep operating to full capacity. It has, of course, been impossible to secure experienced help, but by taking rough labor and educating it, this difficulty has been very satisfactorily overcome, and I do not anticipate further trouble in this respect during the coming year.

Raw Material Receipts

The most difficult problem which we have had to face has been how to secure the necessary raw materials to keep our mill in operation. The transportation companies were tied up in every direction with embargoes and manufacturers as a result got behind in their deliveries. Therefore, in order to make sure of not being caught without necessary raw mamaterials and coal, we had to anticipate our requirements by months. This has created a very dangerous situation, and most manufacturers have given great thought to the question of reducing as much as possible high-priced stocks, although this can only be done to a very limited extent if one wishes to keep his

Continued on page 694.

degree to which inspection is carried. Starting in the wilds of British Columbia forests, where the finest aeroplane lumber in the world is cut, the process of scrupulous selection decides which of the upstanding timber are to be felled and utilized in airplane construction. After the timber is sawn up in the mill, it is subjected to a minute inspection for knots, irregularities in the grain, and other defects which might spell disaster in the crucial test, and all prices showing weak spots are eliminated. This ensures only wood of certified quality reaching the factory, but even with this precaution a close check is put upon every stage of its progress through the shops, to detect any possible flaw which might develop in the course of construction.

To begin with, all wood received into stock is checked by Government inspectors at the factory, after which it may be released to be worked up into longerons, struts, and so on down to the thinnesb lamination of a web piece. During the course of manufacture, each and every piece is inspected by shop inspectors after passing through an individual operation. The larger pieces must conform to a required weight within certain limits and be absolutely free from knots, cracks, twists, worm holes, etc., after which the finished piece is inspected by Government inspectors and stamped before entering into the makeup of the machine.

ASSEMBLING WING STRUCTURE. TWO LONGITUDINAL MEMBERS ARE CONNECTED BY CROSS RIBS COMPOSED OF NOSE-PIECE, CENTRE AND TAIL-PIECE.

Material Testing

The same care is exercised with metal and fabric. In the testing laboratory one sees a 100,000 lbs. horizontal tensile testing machine for material such as bronze and steel rods bolts, etc., and a 20,000 lb. vertical machine for tests on wire, turnbuckles and similar items of aeroplane construction. Passing into the metal shop, the diversity of material and processes becomes more apparent. Aluminum, steel and bronze are seen on every hand: sheets, rods, bars and tubes. Modern methods and arrangement are immediately evident. The actual amount of metal work in an aeroplane, outside of the engine, is not of great bulk or quantity, but in quality it must be of the best. A simple but very important item in this respect is the turnbuckle. Of harmless appearance, simple design, and small size, this innocent looking article is a vital component of the structure. A burst turnbuckle is just as certain to cause the collapse of a machine as a torn artery will cause the death of a man.

Structural Requirements

A study of the structure of an aeroplane frame or fuselage as it is technically termed makes this clear. Of rectangular form with a convex deck, the fuselage is formed of four longi-

tudinal members or longerons, spaced apart by wooden compression members, and given the desired strength and resilience by means of a multiplicity of wire stays which intersect in every panel of the fuselage both longitudinal and transverse. The adjusting of these stays is done by means of turnbuckles which in the hands of a skilled operator enable the tension in the various parts of the structure to be so balanced that each component receives no more than its due stress while the machine is in use. If through bad adjustment or defective manufacture, a turnbuckle receives or takes less than its due share of the stresses, some other one is overtaxed, and, with the small margin of safety allowed, disaster is sure to follow.

WOMEN OPERATORS COVERING WING FRAMES AND CONTROL DETAILS WITH SPECIALLY MADE LINEN. THE DEFT FINGERS OF GIRLS ARE WELL ADAPTED FOR THIS WORK.

Considerations such as these, as well as others, render the installation of a turnbuckle department an essential feature. In this, as in other work, it is not so much what is being made as the way it is being made which influences the final result, and beyond the use of standard types of screw machines and small tools there is nothing unusual in the way of equipment. It is the sequence of operations, the amount of work done at certain stages, plus a rigid inspection system which has insured the success of this vital work.

PLAN VIEW OF AEROPLANE SHOWING STABILIZER AND RUDDER SECTIONS. ALSO AILERONS AT NEAR EDGE OF WING TIPS.

Press Work and Welding

The work of the press department consists in cutting and forming aluminum sheets into deck housings, engine hoods and side panels, and the stamping and forming of the numerous sheet steel parts which are afterwards welded to form the brackets which are used at the junctions of the different struts or compression members. A particularly fine piece of this latter work is the radiator cradle which rests on the front end of the longerons and supports the radiator. Stamped from sheet steel with an intricacy of perforations it is formed by hand on complicated die blocks and has additional members secured by welding resulting in a most efficient piece of construction when weight and duty are considered.

Both oxy-acetylene and electric welding are employed, the variety of work performed being such that ample opportunity is found for the special application of either process.

All the work from the metal shop

SEVERAL COATS OF VARNISH ARE APPLIED TO THE LINEN FABRIC, MAKING IT IMPERVIOUS TO ATMOSPHERIC INFLUENCES, AND REDUCING SKIN FRICTION IN THE AIR.

passes through two separate inspection departments before acceptance for assembly. The first of these is the regular plant department, while the second is the Army Inspection Department maintained by the Imperial authorities who control aeroplane construction in this country the same as in Britain.

Plating and Enamelling

After being passed for workmanship and material, much of the work has to be plated to stand exposure to weather, which in the case of aeroplanes is more than ordinarily severe. Plating machines are installed for mechanically handling screws and similar small parts, while the larger parts which require individual handling are plated in vats of conventional type. In addition to the plated finish, there is a considerable quantity of parts which are finished in enamel, both black and white being extensively employed. All of the tubular frame work of the rudder, stablizer and elevators which is afterwards covered with fabric is heavily coated with white enamel. The destructive effects of rust on the fabric covering render it imperative that the metal tubing be made rust proof as far as possible, a requirement which is not facilitated by exposure to the atmosphere at high speeds in all kinds of weather.

For this purpose air brush equipment has given satisfactory results, the liquid enamel being sprayed by a jet of air under pressure which atomizes the enamel and causes it to impinge on the work with considerable force so that adhesion is improved and the density and smoothness of the protective coating is considerably enhanced.

Heat Treating

The exceptional conditions of service call for heat treating of much of the metal work. Axle tubing, turnbuckle eyebolts, levers, brackets and similar articles are made of special alloy steels whose characteristic qualities of extreme toughness, stiffness, hardness or flexibility can only be made available by a suitable series of heating and quenching operations. Such work demands carefully designed furnaces and skilled operators and the widespread application of heat treatment in shell manufacture has done much to facilitate a due appreciation of the importance of this work both by management and operators. Sandblasting, brazing and trimming are also required at various stages, and the nature of equipment renders their location adjoining the heat treating department desirable; polishing and grinding work is likewise included in this group.

AEROPLANE CHASSES RECEIVING FINAL DETAILS. THE WING SECTIONS ARE SHIPPED DIRECT TO THE TRAINING GROUND AND ASSEMBLED THERE.

Woodworking Features

It is not until the wood shop is entered, however, that the real aeroplane atmosphere begins to affect the visitor. The indispensability of wood as a material of construction and its use in large pieces for essential elements such as wing frames, struts and other conspicuous parts enable the parts to be recognized in the rough and their gradual approach to finished shape with each succeeding operation retains the interest of the layman to a surprising degree.

Following a large timber of considerable length, one sees it split into two by a powerful band saw, then thicknessed and straightened, routed out on the sides to reduce weight and finally, after careful finishing to exact sizes and weight, it is assembled with nose pieces, centres and tail pieces to form the wing frame which is covered with linen and finally varnished. A finished wing is a wonderful achievement when strength and weight are considered and its satisfactory manufacture in quantities can only be achieved by the use of the best of materials and workmanship.

An interesting stage of the woodshop is where the longerons are steamed and bent to shape. These extremely important parts are made of the highest grade of ash and are subjected to a series of weighing at various stages to insure uniformity of seasoning. They measure roughly about 25 ft. in length, by 1½ in. square, and after being steamed in a chest for some length of time, they are withdrawn rapidly, clamped by one end to a templet, and then bent around the curved outline and secured at several points, after which it is allowed to cool naturally and retains the shape imparted to it by the templet.

Laminated Engine Beds

Another operation which demands attention in this department is the building up of engine foundation timbers. This work is of the first importance as fracture or looseness in this part of a machine is fatal. Approximately 4 in. by 3 in. by 3 or 4 ft. long, these timbers are made of laminations about ⅜ in. thick, selected for grain so that by skilful disposition of oppositely grained pieces the resulting timber is proof against warping and possesses exceptional resistance against torsion, bending and shock.

So the various components gradually assume shape until they are ready for erection or final assembly. Here the future flying machine takes form rapidly. Longerons and struts are assembled, stays and turnbuckles adjusted, axle and wheels attached beneath the front end, and landing skid below the tail. In close succession the stabilizer and rudder are placed in position and the control wires coupled up to the seats. The engine is bolted down and the operating mechanism adjusted to the front seat. Accessory equipment such as revolution indicators, barometer, etc., are installed. The wing sections are finally fitted in place and every part subjected to a minute inspection before being disassembled for shipment.

The End Not Yet

And thus the work of building the most marvellous of man's creations goes on in our midst. The one problem which has baffled mankind from the beginning of time has been solved through the combined labors of scientists and investigators, engineers and daredevils of many nations. Gradually, but irresistibly the aeroplane has become a familiar sight and topic with the general public and the certainty of its manufacture assuming industrial and commercial importance rivalling that of the automobile is not the least noteworthy belief of those whose efforts are devoted to it in its present stage.

WATER-POWERS OF CANADA

WITH coal at a high price and the prospect that we shall soon have to depend largely on our water-powers for heating our houses and running our railways, a reliable estimate of what our water-power resources are is of great value. The Commission of Conservation first published an estimate of this kind in 1911. Since then, it has conducted water-power surveys of British Columbia, Alberta, Saskatchewan and Manitoba, and has secured aditional data on the powers in other provinces. It now submits the figures below as being the latest available.

Province	Total Possible H.P.*	Developed H.P.
Ontario	5,800,000	760,000
Quebec	6,000,000	640,000
Nova Scotia	100,000	26,000
New Brunswick	300,000	15,000
Prince Edward Island	3,000	500
Manitoba		76,000
Saskatchewan	3,500,000	10
Alberta		33,000
Northwest Territories		Nil
British Columbia	3,000,000	250,000
Yukon	100,000	12,700
Total for Canada	18,803,000	1,813,210

* The figures in this column are given with much reserve since it is practically impossible to arrive at exact amounts for any country. In addition to detailed surveys and flow records, such factors as artificial storage, economic head to be developed and kind of industry to be established all vary the estimates for each individual site.

INDUSTRIAL DEVELOPMENT AT CANADIAN HEAD OF GREAT LAKES

AT Port Arthur and Fort William, the great inland twin ports of Canada, activity and progress are again evident after a stagnation period caused by the world-wide war. These cities are the great transhipping ports for the ever-increasing products of our western provinces, and will become (with the deeper channel to the sea which in the improved Welland Canal is in its initial development) practically an ocean seaport for half a continent.

There is no site on the American continent that has so great a future ahead as the twin ports of Canada. In the territory adjoining the essentials to manufacturing prosperity are found—unlimited areas of pulpwood lands for pulp and paper manufacture, vast iron ore lands, gold, silver, nickel and other minerals; in fact, no place on the continent has a superiority of indications of so vast and varied mineral wealth, which is only awaiting the necessary capital for successful development. Besides the great mineral bodies adjacent to the twin ports, there is also abundance of agricultural lands for raising produce; besides there is that great essential to economical mineral development and manufacture—cheap power.

Power Available

Within connecting distance of the twin ports are magnificent water powers, which only await the time of harnessing for industrial development. In the Pigeon River, Kakabeka, Dog Lake, Virgin and Cameron Falls, besides other waters capable of being utilized, are embodied vast potentials for industrial activity and progress. It is computed that at least 250,000 horse-power of electrical energy is capable of development for use at the twin ports. Previous to the war coal was laid down at the docks for less than fifty cents a ton freight from Lake Erie.

Industrial Enterprise Progress

With 35 miles of deep water lake and river frontage capable of being utilized for dock, factory and mill purposes within a radius of 5 miles from a central point, there is scarcely a limit to future possibilities. At Port Arthur during the past year there has been erected the first unit of a large pulp and paper mill by the Port Arthur Pulp & Paper Co., this unit being the first of the total projected capacity of 150 tons of pulp daily. There is also a pulp and paper company with even a greater output in sight under organization, the necessary pulpwood areas already having been secured. Another Port Arthur industry of note is that of the Port Arthur Shipbulding Co., which has had a busy season, having had about 1,000 men constantly employed, chiefly in the construction of ocean steamships of approximately 4,000 tons capacity, the limit possible for passage through the St. Lawrence Canal.

The Port Arthur Waggon Works has also been continuously employed in manufacturing waggons and other implements. The Government Fish Hatchery, located at Port Arthur, has achieved splendid results this year, having developed and placed in waters suitable for their full development millions of young fish. The construction of large terminal elevators on the water front at Port Arthur goes merrily along.

During the year the Grain Growers' Grain Co. hospital elevator has been increased by 300,000 bushels, making this plant 600,000 bushels capacity. This concern, which embraces approximately 20,000 Western farmers as shareholders, will concentrate all terminal facilities at Port Arthur, the site there, already secured, being fully adequate for their needs. The next unit projected is that of a 2,500,000 terminal storage elevator. The Saskatchewan Co-operative Grain Co., which represents approximately the same number of Western farmer shareholders as the other, have their big ter-

minal elevator of 2,500,000 bushels just about completed, while the Eastern Elevator Co. are making good headway with the construction of their 2,000,000-bushel elevator. With the completion of the elevators now under erection the twin ports will have a grain storage capacity of 51,575,000 bushels.

Munitions production has been undertaken at the shipbuilding and other plants.

The mineral depots adjacent to Port Arthur are receiving greater attention than formerly owing principally to the mineral exhibit and school established through the Port Arthur Board of Trade for the education of explorers in minerals and their location. Several copper mines in the district are already shipping ores to smelter.

On the whole, Port Arthur, in her industrial and commercial life, has experienced one of the most prosperous seasons of her existence.

IMPORTS PROHIBITED INTO U.S.

THE following articles are included in a list issued by the United States Government recently of commodities that cannot be imported into the United States, from any country, except under license. Antimony, antimony ore, asbestos, balata; castor oil; cotton; chrome, chrome ore, or ferro-alloy or chemical extracted therefrom; cobalt, cobalt ore, or any ferro-alloy or chemical extracted therefrom; all ferro-alloys; flax; gutta joolatong; gutta percha; gutta siak; hemp; hides and skins; jute, iridium; leather; manganese, manganese ore, or any ferro-alloy or chemical extracted therefrom; mica, molybdenum, molybdenum ore, or any ferro-alloy or chemical extracted therefrom; naxos emery and naxos emery ore; nickel, nickel ore, matte, or any ferro-alloy or chemical extracted therefrom; sodium, potassium, or calcium nitrates; optical glass; palm oil; platinum; plumbago; pyrites; rubber, raw, reclaimed, waste or scrap; scheelite; shellac; sisal; spiegeleisen; sugars; tanning materials; tin in bars, blocks, pigs, or grain or granulated; tin ore and tin concentrates, or any chemical extracted therefrom; titanium, titanium ore, or any ferro-alloy or chemical extracted therefrom; tungsten, tungsten ore, or any ferro-alloy or chemical extracted therefrom; vanadium, vanadium ore, or any ferro-alloy or chemical extracted therefrom.

WAR HAS DEVELOPED MOLYBDENUM PRODUCTS

THE demand for molybdenum for use in the manufacture of special steels has greatly stimulated prospecting and development of our molybdenite resources. Numerous discoveries have been made which vary in importance from mere mineral occurrences to deposits which have already given considerable production. The most important deposit yet proven is that near the village of Quyon, Quebec.

The Federal Department of Mines has done much to encourage the concentration of these ores. After trial shipments had been made for test runs in the United States, the ore from Quyon mine was principally sent to the concentrating plant of the Mines Branch. The company has recently completed a concentrating plant to take care of their output.

CO-OPERATIVE FOREST PROTECTION IN QUEBEC

QUEBEC has made a distinctive contribution to forestry work in establishing the success of co-operative fire protection associations. In these, the timber owners band themselves together to protect their limits from fire, sharing the expense on an acreage basis. The Provincial Government also contributes towards the expenses in consideration of the protection afforded unlicensed Crown timber lands. One great advantage of the association idea, especially when the provincial forest service is appointed for political reasons instead of for merit, is that the owner-members of the association see that only competent rangers are employed.

Quebec now has under co-operative fire protection fully 67,000 square miles of forest lands, comprising the greater portion of the licensed Crown timber lands as well as a large portion of the Crown granted lands. Under this arrangement, the St. Maurice Forest Protective Association, the pioneer in the movement, looks after the St. Maurice district, the Ottawa River Association guards the large territory bordering on the Ottawa, and the newly formed Laurentian and Southern St. Lawrence Associations protect the districts on the north and south of the St. Lawrence river, respectively, in the eastern portion of the province.

POWDERED FUEL

A LARGE proportion of Canada's reserves of coal is unsuitable for use in the ordinary way as locomotive fuel. The coals of Manitoba, Saskatchewan and portions of Alberta are lignite or sub-bituminous, high in moisture, and owing to excessive "sparking" cannot be used as locomotive fuel because of their liability to set fires. There is a possibility that pulverization will overcome the disabilities of this type of fuel, and W. J. Dick, mining engineer of the Commision of Conservation, is investigating the problem and compiling information respecting the use of powered coal and peat as a fuel for locomotives, stationary boilers, cement plants and metallurgical purposes. This class of fuel has already been used with economic success in a few plants. If it can be proven to be a sucess generally, it will mean that we can utilize much low-grade coal that, heretofore, has been largely wasted, and will lessen the ever-increasing cost of generating power from high-grade coals and fuel oil.

GASOLINE SUPPLY CONSERVATION

ABOUT 20 per cent. of the gasoline we use is produced from Canadian crude oil, while the remainder is either imported or is produced from imported crude oil. For both petroleum and gasoline we are largely dependent upon the United States. There, the consumption of gasoline is greater than the production, the excess being drawn from the surplus production of earlier years, and the greater demand, for war purposes, in 1918, will inevitably result in a greater consumption than formerly. At the same time, while the production of gasoline in the United States in 1917 will probably be less than in 1916, it is estimated that the consumption this year will exceed production by 60,000,000 barrels. This enormous deficiency must be drawn from the surplus of 150,000,000 barrels that was in storage on January 1 of the present year.

In view of this situation and its effect on Canada, together with the necessity for conserving gasoline for war purposes, it behooves us to prevent waste, or needless use, to encourage the use of substitutes, and, if economically possible, to develop the oil-shale industry in Canada. One-half of the gasoline used in the United States is used in pleasure riding, and doubtless the same proportion holds good in Canada.

NEARLY FIVE MILLION WOMEN MOBILIZED

ILLUMINATING facts, showing the enormous increase in the number of women workers since the outbreak of war are set forth in a recent issue of the Imperial Government *Labor Gazette.*

In July last 4,766,000 women workers were employed in Great Britain—a number exceeding by 1,421,000 those employed in July, 1914. The number of women who have directly replaced men since the war is given as 1,392,000. About 670,000 women are employed on munition work and 632,000 on other Government work, such as the manufacture of clothing and food for the troops.

The estimated number of females employed in July, 1914, and the increase in July last in the chief occupations, are shown in the appended table:—

	July, 1914	Increase
Industries	2,184,000	518,000
Gov. establishments	2,000	202,000
Agriculture, permanent	80,000	23,000
Agriculture, casual	50,000	39,000
Transportation and trains	17,000	72,000
Trams, municipal	1,200	16,000
Banking and finance	9,500	54,000
Commerce	496,000	324,000
Professions	67,500	20,000
Hotels, theatres	176,000	22,000
Post office	60,500	45,000
Civil service	4,500	53,000
Municipal service	196,200	29,000

The above return does not tell the full tale of the labor of women, since domestic servants and women employed in very small workships in the dressmaking trade are excluded, as well as women at work in military, naval, and Red Cross hospitals. Under the last head there has been an increase equal to 38,000 full time workers. On the other hand, there has been a displacement of 400,000 from small workshops and omestic service.

B. C. Metal Mines Reopen.—The Labor Department, Ottawa, has received word to the effect that work has been resumed in the smelters at Trail, B.C., and that all metal mines in the district which have been closed for the past six weeks owing to the smelter strike will resume operations.

Pushing Yourself Upward in Position and Pay

By John C. Kirkwood

Every man his own salesman—The shame of remaining poor—Most men can double their pay—Examples of self-selling—To get more, sell more—Paying dearly for the privilege of being a leaner—Are you your godmother's beloved child? It's all up to you.

EVERY right-minded man wants to get on in the world—to get higher up and to get higher pay. But not every man with the desire to get on is trying to get on. Many are in a state of semi-repose, waiting for someone, or some force without themselves, to promote them. Because of their lack of initiative, many good men lag behind and remain poor.

No Virtue in Being Poor

Let it be said straightway that there is no virtue in being poor, or lowly-placed, but that, on other hand, there may be discredit and disgrace in being poor and lowly-placed. Many a man earning no more than "the scale" or the market price for the particular kind of service rendered by him should be earning twice as much as he is now getting; and he can earn double his present wage if he has the grit and purpose to multiply his wage by two. The great obstacle in the way of the advancement of many wage-earners in position and pay is a certain contentment with their wages and positions—a contentment that robs them of initiative and ambition.

Leaning on Broken Reeds

Go into any place where men earn wages—so much pay for so much service—and ask each man what he is doing to get on—to get higher up and to get more pay; and the great majority will say, "I'm trying to do my work just as well as I know how. I hope that my employers will perceive my fidelity and the good quality of my work; and that they'll promote me and advance my pay."

You will get an answer like this from common laborers, from skilled artisans, from clerical workers, from executives, from managers, from salesmen, from teachers and professors, from chemists and engineers, from journalists and editors—in short, from all classes of employees.

These men seem to have been taught —perhaps self-taught—that fidelity, ability and first-class performance will, unaided, send them upward and forward. The truth is that while fidelity, ability and superior performance are the bases of advancement, promotion should get its impulse from the employee himself. In other words, if a man wants to get ahead, he should push himself ahead. Failure to get ahead is very often explained by absence of self-pushing.

Doing More Than a Day's Work

If a man wants to get ahead, in pay and position, he must do more than just perform his day's work well. He must, at the same time, be preparing himself for a job higher up—getting ready in advance, by special study. The man who is studying for a job higher up, with the higher pay that usually goes with a higher grade or quality of service, usually possesses purpose. Purpose and Push begin with the same letter. Indeed, if you look at the words relating to advancement, they all seem to be "P" words:—

Purpose	Prod
Push	Practice
Progress	Principles
Promotion	Pep
Power	Performance
Perseverance	Personality
Punch	Proficiency
Preparation	Prosperity
Persistency	Promptness
Pertinacity	Pluck
Polish	Popularity
Publicity	Perception

Failures omit from their vocabulary many of the "P" words listed above—purpose, push, preparation, power. They seem to prefer words beginning with "L":—

Leisure	Laxity
Laziness	Loitering
Listlessness	Languor
Limpness	Lounging
Looseness	Lateness
Lagging	Lackadaisical
Leaning	Lukewarmness

You, the reader of these words, can get some index to the quality of your own life by answering honestly this question —Am I a "P" man or an "L" man?

I.

WHAT are the chances of getting on for an artisan—a machinist, or moulder, or shipwright, for example?

Or to put it more broadly: What are the chances of getting on of the wage-earner—the man who gets so much an hour, or day, or week, or month?

Or to put it more broadly still: What are the chances of getting on for employed men—men who sell their skill, or fidelity, or knowledge, or ability to perform technical or semi-technical work, including professional men such as engineers, teachers, chemists, and so on?

Getting the Right Idea

The chances of getting on, in pay and position, of any class of worker, can be made very certain—almost certain—if the worker himself (1) gets the right idea and (2) has the grit to follow the right idea in the direction of its beckoning.

The right idea is: Every man must sell himself, by the exercise of his own initiative, to those who will pay him his worth; and he must keep on in this selfsame selling effort.

You ask, How can a man sell himself? What do you mean by "selling himself?" Let us answer these questions with suggestive illustrations.

A printer—a compositor—went to his employer with a new floor arrangement of composing frames, imposing table, galley racks, linotype positions, paper-cutting machine, presses, and so on; an arrangement that meant less waste motion, much saved time, and greater output at no increased cost. For his initiative and because of the indubitable value of his suggestions, this compositor was promoted to a higher position, with higher pay. This compositor sold himself to his own employer—sold an idea of his own thinking and observation. He did not wait for promotion, but speeded its coming by an effort of his own.

A Carpenter Has a Bright Idea

A carpenter showed his employers—a wood-working firm—how they could utilize much waste wood for the making of small wooden toys. For this suggestion, representing, as it did, a new source of revenue, and ultimately a new and highly profitable department, this carpenter was promoted in position and pay. In other words he sold something —an idea, a new business—to his employers.

A grocer's clerk showed his employer how he could find a new and extensive customer out of whom much extra profit could be made. He suggested that his employer should open a restaurant at a location where a restaurant was greatly needed. The grocer took up the suggestion, and found himself selling bread, biscuits, canned vegetables, tea, coffee, cheese, fruits, pickles, rice, potatoes, and a score of other grocery lines at higher-than-store prices, and always for cash. The grocer's clerk making the suggestion was given an interest in the new undertaking, and improved his income very substantially. That is, an employed one sold something of his own —an idea—to a buyer of it, and was well paid for his merchandise.

He Sold Himself to Himself

A machinist took up a correspondence course in draughtsmanship, in order to lift himself into a higher grade of occupation, with higher pay. When fully prepared, he applied for a position advertised, got it, and improved his grade of employment. While a draughtsman, he prepared himself as an electrical engineer, taking evening work in an institute of technology; and finally its examinations. To-day he is a consulting engineer, obtaining high fees. The machinist became possessed of market-

able wares which brought in a higher rate of pay than the sum per hour he received as a machinist. In other words, he sold himself—his ability and training—in a better market; and he continued to sell his wares—his ability and training, which he steadily improved—in still higher markets.

A teacher in a High School took post-graduate work at Harvard, secured his degree of Doctor of Philosophy, and in the course of a few years of directed purpose became a University professor at a higher annual remuneration than he could ever hope for as a High School teacher. At the same time, he increased himself in prestige, and shortened his working year from September-June to October-May. This teacher, by preparation, guided by purpose, and by the exercise of initiative, sold his wares—superior learning—in a better market.

A manager, on salary, wanting and needing more money, conceived the idea of a central buying agency for a number of retailers. He took his idea to an astute business man and sold it to him along with his own services. To-day that manager is making five times what he formerly made, and owns a substantial interest in the business he originated.

Promotion Lags For Some

The men who get ahead in this world are those who lift themselves to higher positions, who acquire fitness for higher positions in advance of seeking and occupying them. Most of us are willing to take higher positions and higher pay, promising ourselves, if we get higher positions and pay, by favor more than desert, to qualify for the higher post and pay **afterward.**. Promotion lags for the unprepared, and rightly so. Men that won't move forward beforehand are not likely to carry into higher posts a progressive spirit.

II.

THE message of this contribution to CANADIAN MACHINERY is addressed in particular to artisans—machinists, foundrymen and men in like employment; to clerical workers, to secretaries; and even to managers; especially to those who are not making progress in position and pay. If you are worth more money than you are now receiving, it is a burden upon your own shoulders to get the money you are worth. It is for you to seek more money, some place, on your initiative. In other words, you must sell yourself to some buyer who will give you a better price for what you have to sell than you are now getting. Perhaps—probably—this buyer is your present employer.

You Must Have More to Sell

If you are not worth more money than you are now getting, and yet desire more money or advancement, it is clearly up to you to make yourself worth more money. In other words, you must have more to sell—more skill, knowledge, productive, executive, or managerial ability. Having more to sell, you are in a favorable position to demand more money or recognition, or both.

III.

IT has been said that there are two classes of people in the world—leaners and lifters; and the leaners are in overwhelming majority. These leaners want to be carried; want their way to be made easy for them; want other men to find work for them; need others to watch over them in order to do their best work; and want others to lift them to better-paid work and work of a better sort.

They remain dependent children all their life long; and if they get some kicks and curses for leaning their weight on others who want to get ahead, or for hanging on to the coat-tails of men of greater strength and speed, they feel aggrieved, and develop socialistic views. And when old age comes, these leaners, grown feeble from their much dependence, may become a burden on their friends or kindred or perhaps on the State.

Leaners or Lifters—Which?

The question is inevitable: Are you a leaner or a lifter? If you are a leaner, and continue to be one, you cannot possibly earn as much as the man of equal fidelity, ability and performance with initiative and courage to exercise these qualities.

When you lean on a man—rely on him to find work for you and keep you at work, for wages—you pay him a substantial sum each year for the service you require of him. If you get from an employer $3.50 a day, then he expects to get back $5 or so for the $3.50 he gives you; and he gets this $5 or so out of what you produce. That is, he expects to get $1.50 a day, or $9 a week, or $450 a year per employee, over and above what he pays the employee. And if he employs 100 employees, it means that he gets $45,000 more than he pays them. Applied personally, it means that you, a leaner, pay your employer $450 or so each year as a fee for finding you work.

A Machinist Gets the Right Idea

When this idea sank into the mind of a certain machinist, he determined that he would sell himself to himself, and not to any other. He had a little money saved up—less than $500, and with this capital he opened up a small machine shop in the basement of his house. Here he worked nights until he developed a connection sufficient to permit him to give up his day job elsewhere. It was not long before this machinist with initiative found it necessary to transfer his machine shop from the basement of his dwelling to a regular shop and to employ assistance. To-day this man is an employer, and is drawing a very satisfying income by collecting $1.50 a day or so from each of twenty men who want their jobs found and maintained for them.

IV.

HOW is it with you, brother? Are you depending on your fidelity, ability and superior performance to advance you in pay and position, or are you practising salesmanship—doing a little pushing on your own account in the direction you want to go? Are you acquiring more in order to be able to sell more—more education, more knowledge, more skill—in short, more of the kind of merchandise you are selling?

How are you using your spare time—the time you call your own? Are you converting it into capital for to-morrow's needs? Are you reading books above your level—the only kind of books that educate you, stimulate you, lift you? Do your dreams lull you to sloth and sleep, or do they drum you out of repose and inaction?

Time—your free time—is a godmother, ready to bestow all manner of wealth on you, if you are her beloved child.

None but yourself condemns you to positions of lowliness and low pay. If you want to earn twice as much as you are now doing, you can surely do it, if you make yourself worth twice as much, and make others know your worth. It's all up to you.

EASTERN CAR CO. 1917 OUTPUT

THE Eastern Car Co., New Glasgow, N.S., has not been without a fair share of the manufacturing activity arising from railroad rolling stock contracts placed during the present year. A total of 4,640 freight cars have been built and shipped, outstanding features being that the majority were to foreign order and all were of steel frame construction. The shipments were as follows:

Paris-Orleans Railway, 1,600 box cars of 20 tons capacity.

French State Railway, 540 gondola cars of 20 tons capacity.

Russian Imperial Government, 2,000 box cars of 1,200 pood capacity.

Canadian Government Railways, 500 box cars of 50 tons capacity.

CANADIAN FURNACE CO., 1917 OUTPUT

DUE to the scarcity and high price of pig iron during the year, it may perhaps be superflous to state that the plant of the Canadian Furnace Co., at Port Colborne, Ont., has been operating to capacity in the twelve-month period. Only foundry and malleable pig iron are produced and of these commodities the total out for the year on a close estimate is 109,000 gross tons, all of which was sold to Canadian consumers. Due to the continuance of abnormal metal-working plant activity, the outlook for the coming year is of the brightest possible description.

Hydro-Electric Development. — The development of hydro-electric power in Canada, and especially in the Provinces of Ontario and Quebec, during the last ten years has been almost incredible. At the beginning of the work of the Ontario Hydro-Electric Commission, the late Premier, Sir James Whitney, stated the Commission would not require so much as 10,000 h.p. There is now, in round figures, an immediate demand for 300,000 h.p., and the demand cannot be satisfied.

Plant, Equipment, and Product, The Goodyear Tire & Rubber Co of Canada.

The rise of rubber in industrial importance from a laboratory curiosity to one of the most indispensable substances of civilization, in peace or war, forms one of the romances of the nineteeth century. The extent to which rubber enters into the needs of mankind's daily existence are numerous beyond belief, and the immensity of the plant described in this article, devoted as it is to one special product, will serve to emphasize the importance of rubber.

THE factory which the Goodyear Tire & Rubber Co. of Canada, Ltd., have recently built at New Toronto, Ont., is symbolical of the remarkable success which has attended the automobile tire manufacturing business in the Dominion, and, judging from the plans which this concern has made for future enlargement, there is every expectation of even greater expansion in this industry. The Goodyear Co., as is perhaps well known, supplied until now the Canadian trade from their factory at Bowmanville, Ont. The need for greatly increased manufacturing facilities to meet the demand for their product ultimately became urgent, and New Toronto was selected as the best location for the new tire plant. The Bowmanville factory, however, is still in operation, and is devoted exclusively to the production of mechanical rubber goods. The removal of the tire plant to the new factory will permit of a greatly increased output of mechanical rubber goods at Bowmanville, while the production of tires at the New Toronto factory will, of course, be considerably greater than at the old plant.

Experience Plus System

Advantage has been taken of many years' experience in the tire business to plan the layout of machinery and equipment at the new factory, and in this respect it may be said that nothing has been omitted whereby the rapid and efficient production of tires is made possible. The various processes, from the mixing of the raw materials to the finished product, follow one another in regular sequence, with no waste effort or back trucking. Each operation or process has also been carefully planned to produce a perfect tire without any undue expenditure of either time or energy. The resultant efficiency enables producing costs to be kept within prescribed limits.

An elaborate cost system is employed, which enables the staff to keep track of all charges and eliminate unnecessary expenditure of time or material. An experimental department is maintained to try out new ideas either in the mixing of raw materials or in manufacturing processes. In connection with this department is a chemical and physical testing laboratory. The statistical department collects and prepares all kinds of data relative to the operations in the factory, while there is also an efficiency department. Needless to say, all the departments work together with the common aim of maintaining a high standard of over-all efficiency.

Social Features

A suggestion system is in force, many valuable ideas having been submitted by its means and adopted. Boxes with paper and pencil are located at various points to receive suggestions, and any practicable ideas are rewarded in a substantial manner, according to their value to the firm. This system has the advantage of making the employees interested in their work, as well as being beneficial to the company. A welfare department has been organized to adjust complaints and generally look after the health and comfort of the employees. In this connection an athletic field will be laid out and sports of all kinds instituted. This feature will not be inaugurated until the spring, when the weather will permit of laying out the grounds. On the top floor is a cafeteria, where four meals a day are served at cost price. This is a great convenience on account of the entire absence of restaurants in New Toronto.

The company have a property covering about 26 acres, with a frontage facing south on the Toronto-Hamilton Highway. The factory stands some way back from the road, thus leaving sufficient space for future extensions. A spur from the Grand Trunk Railway System enters the property at the back or north side, where the power house is located. The factory comprises one large main building, a power house, cement department and spreading room. The last three mentioned are separate buildings, and are at the back of the main structure. It is the intention of the company to lay out the grounds surrounding the factory in an attractive manner when the weather becomes more favorable for turfing and planting trees. The surroundings will be made as congenial as possible for the employees. The space in front of the main factory building is sufficiently large to allow of two more units being constructed, provision having been made for extensions when the present factory was planned. The same idea was kept in view when the power house was designed, extensions being possible without interfering in any way with the present layout.

Building Details

The main building is 460 feet long by 100 feet wide, and is laid out in 20 feet bays each way. The building comprises four storeys and basement, and is approximately 70 feet high from the ground level. The basement is 12 feet high, and the first floor 22 feet high. The second and third floors are both 15 feet high, while the top floor is 12 feet high to the lower chord of the roof truss, plus 5 feet for the latter. The general construction material of the building is steel and brick, all internal columns through-

out being encased in concrete. In the construction of the main building 2,200 tons of steel were used and approximately 2,225,000 brick. The brick work is of high quality in spite of the fact that the greater part of it was laid during the winter, the successful carrying on of the work being made possible by a liberal use of salamanders. The ground was broken in July, 1916, the erection of the steel work started in November, and the first brick laid on January 3, 1917. Manufacturing operations were commenced in September of this year.

Fenestra steel sash is used exclusively. There are approximately 45,000 sq. feet of sash in the main building, the sections being about 17 feet wide, and ranging from 8 ft. to 15 ft. high. Each sash is equipped with from one to four ventilators. The monitor in the roof, which extends the full length of the building, is made up of three rows of glass on each slope, two of these rows on each side being equipped with opening mechanisms operated by hand from the floor. With so much space devoted to windows, the factory is exceptionally bright and well ventilated. This feature strikes the visitor immediately upon entering, and is a valuable one in that it means healthy conditions for the employees, and consequently more efficient work.

The basement extends under the entire building except for 100 feet at the west end. The basement floor is made up of 8-inch concrete, on which is laid two ply of waterproofing material. On this again is laid 1½ inches of mastic ashphalt. Under the floor is a complete system of tile drainage leading to sewers which are laid in the centre of the building throughout its entire length. There are three lines of sewers for drainage, rainwater, and water from the factory respectively. Downspouts from the roof are placed 40 feet apart inside the building, and are carried to one of the abovementioned sewers. The first floor is made up of 2 by 4's, laminated on steel and finished with maple flooring for a length of 320 feet.

Another section of the floor, comprising 60 feet, is concrete on steel, with mastic finish laid on waterproofing. The remaining 80 feet is composed of wood blocks laid on concrete. The second floor is made up of 2 by 4's, laminated on steel, with maple finish, except for 80 feet, which consists of wood blocks on concrete. The third floor is composed of laminated 2 by 4's laid on the steel, with maple finish, except for a length of 80 feet at the west end, which is of concrete with cement finish and hardened. The fourth floor is of the same construction as the third. The roof is constructed of 1⅞ by 6 in. boards laid on steel purlins and covered with 4-ply felt. The pitch was poured and not mopped, while the felt is covered with slag instead of gravel.

Elevators and Lavatories

The building is at present equipped with three elevators, but provision has been made for two more. The capacity of each elevator is 6,000 pounds, and the platform is 7 by 11 feet. All the elevators run from the basement to the top floor and are electrically driven. Each elevator at each floor is equipped with a rising gate, and the openings are protected with steel rolling shutter doors. The elevator and stair wells are of brick and steel construction. All floors and landings are of concrete on steel and have a mastic ashphalt finish. The stairway construction is steel trough, with concrete filling and mastic treads. One notable feature in the construction is the absence of foundations for supporting the heavy mill lines and other heavy machinery on the first floor. The machines are supported on steel beams carried on the main columns of the building. This method of construction gives a clear and unobstructed basement.

FIG. 1. COMPOUNDING DEPARTMENT WHERE RUBBER AND THE VARIOUS INGREDIENTS ARE WEIGHED AND PLACED IN BOXES.

Considerable attention has been given to the welfare of the employees in the matter of lavatory accommodation. Lavatories and toilets are provided on each floor, being located on the stairway landings and in separate rooms. The lavatories are provided with hot and cold water, while liquid soap is piped to each bowl from a small overhead tank. Paper towels are provided in preference to the old-fashioned and unsanitary roller towel.

A well-equipped machine shop occupies a part of the main floor at the west end. The equipment installed includes a general line of machine tools suitable for effecting repairs and making parts for the machinery in the factory, the company being independent of outside help in this respect except for castings or heavy work.

Transmission Equipment

The transmission equipment in the factory was supplied and installed by the Dodge Mfg. Co., Toronto, while the ball bearings on the line shafting are of the Chapman type, there being over one hundred sets of ball bearings of one size, in addition to others of varying sizes.

Fire Protection System

A sprinkler system is installed throughout the plant connected to the overhead tank and fire pump. Branches from the system are taken off from four separate risers at different points in the building, each riser having a control valve. There are 6 sprinkler heads to every 20 feet square bay on all floors. The entire system including valves is painted red, all other piping being black. The sprinkler system was installed by

FIG. 2. SECTION OF MAIN FLOOR SHOWING WARM UP MILLS AND CALENDERS. NOTE CONSTRUCTION OF FLOOR AND LOFTY INTERIOR.

the H. G. Vogel Co., Buffalo, N.Y. The tank for the sprinkler system has a capacity of 75,000 gallons and was constructed by the Chicago Bridge & Iron Co., Bridgeburg, Ont.

The power house is one of the outstanding features of the Goodyear factory, embracing as it does some unusually fine equipment. The building is of large proportions and substantial construction while the architectural features are also noteworthy. In the layout, provision has been made for installing additional units and also for making extension to the building when necessary without interfering with the plant as installed at the present time.

Constructional Features

The building is of steel and brick construction and is divided into four sections, namely, the boiler room, pump room, motor generator room, and transformer room. These rooms have the following dimensions:—Boiler room 58 feet by 88 feet; pump room 40 feet by 66 feet; motor-generator room 36 feet by 66 feet, and transformer room 22 feet by 66 feet. This gives the building a total length of 156 feet and a width of 88 feet at the boiler room end and a width of 66 feet for the remainder of the length. The boiler room is 40 feet high, as are also the others.

The windows are of steel sash, are arched in semi-circular form which improves greatly the general appearance of the building. The roof is composed of 2-inch concrete reinforced with ferro-inclave, laid on steel purlins, the ferro-inclave being plastered on the underside. On top of the concrete are laid 2 inch boards which in turn are covered with 4 ply felt roofing, the pitch for same being poured not mopped. This again is covered with slag. The building is fireproof, while the wood over the concrete prevents the roof from sweating.

The basement under the boiler room is 16 feet deep. Two of the basement walls while acting as retaining walls are constructed of brick to allow for future extensions in both these directions. The boiler foundations are of concrete, 16 feet deep. They are constructed so as to take care of expansion and contraction, expansion joints being provided as in the case of the boiler setting. The stack is built in one bay of boiler room, the gases being led to it through a smoke duct in boiler foundations. The stack is 250 feet high and 15 feet internal diameter at the top. Its foundation is of reinforced concrete 36 feet square and designed for a maximum load of 3 tons per sq. foot.

The stack is constructed of radial perforated brick laid with strong cement lime and forming a very strong bond. The perforations form a dead air space around the chimney, insulating the hot column of rising gases on the inside from sudden changes of temperature of the outer air, resulting in a maximum draft under practically all conditions. The stack is large enough to take care of a duplicate boiler installation or a total of six boilers. The stack was constructed by the Custodis Canadian Chimney Co., Toronto.

Equipment Contractors

The power house and its equipment layout were designed by F. H. Breor, chief engineer for the Goodyear Co. Robert L. Finlay is engineer in charge. The entire installation of pumps with one exception were supplied by Epping-Carpenter Pump Co., Pittsburg, Pa. The high pressure piping and fittings were supplied by the Walworth Co., Boston, Mass.; pipe covering by the Canadian H. W. Johns-Manville Co., Toronto; pressure reducing valves by Kiely & Mueller Co. through Arthur S. Leitch Co., Toronto; and steam traps by V. D. Anderson Co., Cleveland, O. The valves are principally by the Lunkenheimer Co., Cincinnati, Ohio. The Crane Co., of Chicago, also supplied some valves. The auxiliary steam turbine and generator set was supplied by the Canadian General Electric Co.

The entire electrical equipment in the power house was supplied and installed by the Canadian Westinghouse Co., Hamilton, Ont. The International Engineering Works, Amherst, N.S., built and installed the boilers. The stokers were supplied by the American Engineering Co., Pittsburgh, Pa.; the fan by the American Blower Co., Detroit, Mich.; and the ash conveyor by the American Steam Conveyor Co., Chicago. All the piping was installed by Bennett & Wright, Toronto. The travelling crane was made by the Northern Crane Wks., Walkerville, Ont. The building was erected by the Dominion Construction Co., and the rolling doors in each of the rooms were supplied by the A. B. Ormsby Co., Toronto. The "Venturi" meter was supplied by Allen General Supplies Ltd., Toronto.

FIG. 3. SECOND FLOOR. FIRE CONSTRUCTION DEPARTMENT WITH STOCK TABLES ON THE LEFT AND BUILDING MACHINES ON THE RIGHT.

Boiler Installation

The boiler installation comprises two 600 h.p. Edgemoor type water tube boilers built and installed by the International Engineering Works, Amherst, N. S. Provision has been made for another unit of same capacity when required. They are among the largest boilers ever built in Canada. A feature of this type of boiler consists in the three longitudinal drums which run into the box header. Another point of interest is the distance between the tubes and grate. The first row of tubes is 12 feet from the grate allowing more than the usual amount of space for combustion so that the gases will be thoroughly burned before coming in contact with any part of the boiler having a lower temperature which would create condensation and thus cause smoke. The boilers have flanged headers and seamless steel tubes,

FIG. 4. WEST END OF SECOND FLOOR WHERE TIRES ARE CURED AND VULCANIZED.

the latter being 4 inch diameter and 20 feet long. The boilers are designed for a working pressure of 200 lbs. per square inch, but are only operated at 175 lbs. They are equipped with Lunkenheimer non-return stop valves, there being a runway with chainblock overhead to handle the valves. Access is gained to the top of the boilers by means of a steel stairway. Reference to the piping is made under another heading. The boiler fronts are equipped with rolling steel doors supplied by the A. B. Ormsby Co.

Mechanical Stoker Installation

The boilers are equipped with Taylor power dump stokers supplied by the American Engineering Co., Philadelphia, Pa. This is a seven retort machine with a continuous overload capacity of 200 per cent. boiler rating and a maximum peak load capacity of 250 per cent. for four hours; the maximum operating economy is obtained at approximately 150 per cent. boiler rating. The Taylor is a gravity underfeed stoker with inclined fuel bed, and has a hinged dump plate operated by a steam cylinder located underneath. The coal from the hopper is fed into the magazine or retort from which two cylindrical rams driven by connecting rods from a crank shaft, and assisted by gravity, push it into the furnace at an angle to the fire surface. The upper ram shoves the coal outward and upward, distributing it in the coking zone. The lower ram working with the upper acts similarly, but instead of forcing in fresh coal, it impels the fuel bed and the refuse toward the dump plates in the rear.

The necessary air to support combustion is furnished by a power-driven fan located in the boiler room basement. The fan which is direct connected to two vertical steam engines, was supplied by the American Blower Co., Detroit, Mich. The air is driven through ducts to the wind box, thence into the tuyere boxes, and in turn through the fuel bed. The driving unit for the fan drives both the fan and speed shaft, which, in turn, drives a crank shaft which actuates the rams. The crank shafts are in sections; there being a section for each pair of rams, while each group of sections is driven from its own gear box. Since the same driving unit operates both stoker and fan, a change of speed simultaneously changes both rate of feeding coal and rate of supplying air.

FIG. 5. TWO 600-HORSEPOWER ROBB WATER TUBE BOILERS WITH TAYLOR STOKERS.

Ash Ejector

A Griffin ash conveyor is installed along the front of the ash pit, which conveys the ashes to a pit outside the building. The conveyor which is operated by steam jet was supplied by the American Steam Conveyor Co., Chicago, Ill.

Pump Room

In the pump room are installed all the pumps required for the various services, also the feed water heater, and air compressor. The layout is as follows:—On the west side are two hot well pumps and feed water heater, a boiler feed pump, two high pressure hydraulic pumps, balancing tank and the accumulator. On the opposite or east side are the fire pump, booster pump, two low pressure hydraulic pumps, air compressor and vacuum pumps. All the valves in the piping system connecting the pumps are located in the basement, and are controlled from floor stands in the pump room. The ten ton overhead Northern travelling crane installed here is operated by hand from the pump room floor. All the piping, both steam and water, is carried under the ceiling of the basement under the pump room. The basement is 12 feet high allowing ample head room. At one end of the basement is a sump for waste water and drainage. The sump is equipped with a bilge pump for delivering its contents into the sewer. The pump is a 3-inch Yeoman Bros. submerged centrifugal, driven by a Canadian Westinghouse motor.

All clean returns from the factory services, traps, etc., discharge normally into the hot wells. Make-up water is supplied to the hot wells to make up for losses. Water is pumped from the hot wells by two 7½ x 8½ x 6 in. pumps located near the feed water heater in the pump room. The hot wells are cross connected so that either can be used independently of the other. A 5 x 8½ x 6 in. Epping-Carpenter duplex pump is installed in the basement for delivering clean returns from a sump to hot wells, in case difficulty is experienced at any time in raising returns direct to hot wells. There is a tank on the main floor for settling sand and sediment in the raw water from the lake that goes to the presses. This tank is at a sufficient elevation to put a head on the pump sections. The tunnel through which all the piping is carried to the factory runs from this basement to the factory building basement.

Returning to the pump room there are two 7½ x 8½ x 6 inch Epping-Carpenter duplex horizontal pumps for drawing from the hot wells and discharging to the feed water heater. The 4,000 h.p. feed water heater was built by Warren, Webster & Co. Camden, N.J. Next in the line is a 3 inch, 4-stage Epping-Carpenter centrifugal boiler feed pump which supplies water to the boiler from the heater at 225 lbs. pressure. This pump is direct connected to a 35 h.p. Can. Gen. Electric a. c., 2200 volts, induction motor. In the line between this pump and the boilers is a 3 x 1 inch, type M register-indicator-recorder. "Venturi" meter supplied by the Builders Iron Foundry, Providence, R.I., through the Allen General Supplies, Ltd. On the same side of the pump room are installed two Epping-Carpenter 10 x 2 x 2 inch duplex, horizontal, outside packed, pot valve, steam driven pumps. These supply water at 1,500 lbs. pressure to the hydraulic presses in the factory, and operate in conjunction with an accumulator having an 8 inch ram of 8 feet stroke. The valves and fittings on these pumps are Crane Co. make. The balancing tank for the low pressure hydraulic pumps is situated on this side. It is 42 inches in diameter by 12 feet high.

Fire Pump and Air Compressor

On the east side of the pump room there is installed at the south end a Blake-Knowles 18 x 10 x 12 inch, horizontal, duplex, Underwriters' fire pump, having a capacity of 1,000 gallons per minute. This pump supplies the sprinkler tank and fire system lines for the factory. The next unit is a booster pump for factory water supply, or alternatively for the fire system. This pump delivers water at 125 lbs. pressure to the factory. It is a 6 inch, 3-stage Epping-Carpenter turbine unit direct-connected to a 150 h.p. Curtis steam turbine running at 1,500 r.p.m. Next in line are the pumps for supplying water at 225 lbs. pressure for the presses in the factory. There are two units for this service, both Epping-Carpenter make, of 12 x 6 x 12 inch, duplex, horizontal pot valve type. These pumps operate in conjunction with the balancing tank, but can also be used for boiler feeding in an emergency.

A Laidlaw-Dunn-Gordon air compressor is located on the same side of the plant. This unit is a 10 x 16 x 16 x 10 x 12 inch, cross compound steam driven, 2-stage machine, and delivers compressed air at 100 lbs. pressure throughout the entire plant. It also operates in connection with the balancing tank and a receiver, the pressure being controlled by a Fisher pressure regulator. The vacuum pumps for the heating system are installed at the north end and east side of the pump room. There are two of these pumps, both being Epping-Carpenter 6 x 10 x 12 inch units. They are controlled by a Mason regulator. The gauge board installed alongside the Venturi meter will have 14 Bristol gauges and recorders for steam, hydraulic and water service pressures, vacuum, etc. In the illustration showing the west side of the pump room, two steam lines will be seen. The one on the left hand is the 10-inch steam line for the factory, and the one on the right hand is the 8 inch line feeding the distributing header for the pumps.

Piping System

The piping system is one of the features of the power plant and a great deal of time and ingenuity has been expended on the layout. In designing the system, the principal objective of the engineers was to have the piping for the various services so installed that a tie-up in the factory would be practically impossible. To provide for all contingencies, the various pumps are connected up with the water mains in such a manner that if one pump fails another can be by-passed into the line; in other words, flexibility is the feature of the piping system. The water is pumped to the power-house from the lake by two 8 inch, 3 stage Bawden turbine pumps located in the municipal pumping station there. The water is delivered to the factory through a 12 inch main direct to the factory distributing system. This water, however, can be by-passed to a 200,000 gallon storage reservoir so that, in the event of the pumps at the lake failing, the factory can be supplied from the storage reservoir by means of a 6 inch, 3-stage turbine pump which delivers the water direct into the factory distributing system. One instance of the flexibility of the piping arrangement is the fire protection system. A Blake-Knowles Underwriters' pump can deliver water from the reservoir direct to the factory supply line or from the regular 12 in. supply line. In the event of the fire pump being out of commission, a turbine pump can be by-passed into the line, thus providing four alternative methods of supplying the factory fire system apart altogether from the overhead sprinkler tank.

FIG. 6. EAST SIDE OF PUMP ROOM SHOWING, FROM RIGHT TO LEFT, FIRE PUMP, BOOSTER PUMP, LOW PRESSURE HYDRAULIC PUMPS, AND AIR COMPRESSOR.

Alternative methods of boiler feeding are also provided, either direct from the feed water heater, which is the regular way, or from either of two hot wells for which another pump is used, or from either or both the low pressure and high pressure hydraulic pumps. The piping system although complicated has proved thoroughly satisfactory in practice. A detailed description of the system would take up considerable space and would doubtless be confusing to the reader so a more general description only will perhaps better serve the purpose of this article. Taking the piping system as a whole, great credit is due Mr. Breor, the Goodyear Co. engineer who designed the

layout, and to Bennett & Wright, of Toronto, who carried out the work.

Steam Piping System

Taking the steam piping first, steam is received from the boilers by two 8 inch lines to the header. The header is 14 in. in diameter, of wrought steel, with wrought steel nozzles or branches welded to it by the oxy-acetylene process. The flanges are of cast iron and the header is 20 feet long. There is a 10 inch line to the factory, an 8 inch line from the header to the pumps and air compressor on the East side of pump room, and two 4 inch lines, one for the pumps on the West side of the pump room and the other line to the boiler room basement for the ash conveyor, fan engine, etc. The piping is designed for 175 lbs. per sq. inch working steam pressure with 100 degrees Fah. superheat.

The 10-in. line extra heavy steel pipe is carried under the pump room into the basement where the pressure is reduced from 175 lbs. to 100 lbs. by a Kiely & Mueller reducing valve. At this point the line leading to the factory is by-passed, and is equipped with an expansion joint, a steam separator, two Lunkenheimer valves, and an Anderson steam trap. From here the main steam line leading to the factory is carried through the tunnel to a point in the factory basement where the steam is distributed for the heating system and for factory purposes, such as heating, vulcanizing, etc.

A relief is installed at each regulating valve to prevent the pressure building up. The distributing line for the heating system is 6 inches on the high pressure or inlet side, and 12 inches on the low pressure or outlet side of the reducing valves. The pressure from the main line for the heating system is reduced from 100 to 30 lbs., and from 30 to 2 lbs. by Kiely & Mueller reducing values.

The 12-in. exhaust steam header is carried the entire length of the pump room basement and collects the exhaust from all the pumping units, and discharges into the feed water heater, or is by-passed to the atmosphere. The exhaust steam header is of standard steel construction with steel flanged fittings. The exhaust pipe from one pump and the by-pass from header consist of spiral riveted wrought iron pipe.

All the fittings which carry boiler pressure are of cast-steel and have Vanstone joints, both fittings and bends being supplied by the Walworth Co., Boston, Mass. All the reducing valves were supplied by Kielly & Mueller, and the steam traps by V. D. Anderson & Co., Cleveland, Ohio. All piping carrying high pressure is covered with 85 per cent., 1½-in. sectional magnesia, with the exception of the tanks, vulcanizers, etc., which are covered with 85 per cent. magnesia block. The exhaust steam piping and low pressure heating line are covered throughout with 1-in. sectional air cell. All covering is painted with two coats of lead and oil, and is finished with brass bands, the whole presenting a neat and workmanlike appearance. The pipe covering was supplied by the Canadian Johns-Manville Co., and was installed by Bennett & Wright.

FIG. 7. WEST SIDE OF PUMP ROOM SHOWING BOILER FEED PUMPS, FEED WATER HEATER, AND HIGH PRESSURE HYDRAULIC PUMPS.

All the high pressure valves are cast steel and were supplied by the Lunkenheimer Co., as were also the non-return valves on the boilers. All clean returns from the factory discharge into two hot wells under the pump room floor. Make-up water is also supplied to the hot wells in sufficient quantity to take care of losses.

Hydraulic Piping System

The raw water which is pumped from the lake is carried in a 12-in. main to the pump room to supply the various pumps, tanks, etc., or direct to the factory supply main. A line is carried from the inlet main to a 6-in. turbine booster pump which supplies water to the factory for general purposes at 125 lbs. per sq. inch. A second connection goes to the fire pump, a third to the low pressure hydraulic pump, and a fourth to the boiler feed make-up water. A 250-lb. pressure line is carried from

FIG. 8. PUMP ROOM BASEMENT SHOWING MAIN STEAM LINE TO FACTORY WITH SEPARATOR, REDUCING VALVE, AND BY-PASS PIPE.

the low pressure hydraulic pump to the presses in the factory, while another line carrying 1,500 lbs. pressure is taken from the high pressure pump, also to the presses. The high pressure service is used for operating the presses and the low pressure service for putting the presses in position for operating.

A 4-in., 50-lb. pressure line is carried to the factory for the plumbing system, while a 2½-in. suction line is taken from the 250 lb. water service line to the hydraulic pump which boosts the pressure to 1,500 lbs. A balancing line is taken from the balancing tank in pump room to obtain uniform pressure on the system. The high pressure pumps operate in conjunction with a hydraulic accumulator also located in the pump room. There is a 2½ inch line connecting the balancing tank with the air compressor. The material used in the low pressure lines is extra heavy steel pipe with cast iron fittings. For the lines carrying 250 lbs. and upwards, extra heavy steel pipe and cast steel fittings are used. Crane cast steel valves are used in the 1,500 lb. lines, and Lunkenheimer valves in the lines carrying pressures below this.

The Blake-Knowles fire pump delivers from the 12-in. intake supply line to the stand pipes in the factory and also to the sprinkler tank. It will also pump water from the storage reservoir to the fire system. The booster pump is connected up to deliver water to the factory for general purposes or to the fire system, taking the water from the incoming line or from the storage reservoir. The two low pressure hydraulic pumps are connected up so that they can be used for boiler feeding in case of emergency. All hydraulic returns are collected in a tank and returned to the pumps.

Heating System

The heating arrangements for the factory are on the low pressure vacuum return system which has been designed to give a temperature of 70 degs. at 10 deg. below zero, Fahr., with maximum wind pressure. In designing the system particular care had to be taken to allow for the large area of glass and somewhat high wind pressure on account of the exposed location of the factory. There is a total of approximately 40,000 sq. ft. of radiation. The building is warmed throughout with wall radiators placed below the windows, each radiator containing an average of 200 sq. ft. of radiating surface. On the supply end of each radiator is a Jenkins valve and on the return end a Dunham vacuum trap. The radiators are hung with special wrought iron brackets which are built into the wall. They are in two feet wall sections, are of new pattern, and were supplied by the Dominion Radiator Co., Toronto.

The distributing mains for the heating system are carried on the second floor ceiling, while risers take care of the third and fourth floors, with drop risers for the floors below. The vacuum return system is carried along basement ceiling to the tunnel and back to the vacuum pumps in the pump room. The roof monitors are taken care of by 1¼ and 1½ inch pipe coils, there being twelve coils containing 10,500 feet of pipe complete with headers, elbows and supports. The coils are arranged so that the entire bank can be cut off by a valve placed on the floor line. The pressure is reduced from 100 lbs. to 30 lbs. and then from 30 lbs. to 2 lbs. by reducing valves which are situated in the factory basement near the tunnel. The entire heating system was designed and executed by Bennett & Wright.

The original plans did not call for a steam heating installation in the power house as it was thought to be unnecessary. Owing, however, to the efficiency of the steam pipe insulation, it was finally found necessary to heat the building. In the power house there are 2,700 feet of radiation. The heating system is similar to that installed in the factory. The cement house and spreading house have a total of 1,500 feet of radiation, and the same system is installed in these two buildings as in the main factory building. The only variation is that the radiators were supplied by Steel & Radiation, Toronto, instead of by the Dominion Radiator Co.

Electrical Installation

There are a number of interesting features in the electric power and lighting installation. The company takes power from the Hydro System but considerable direct current power is also required for a number of the factory motors. The equipment in the motor generator and transformer room will be taken together in the description given below, being naturally dependent upon one another. In the motor generator room, provision has been made for an additional unit which may be installed in the near future. Runways have also been provided for an electric traveling crane which however has not as yet been installed. The accompanying illustration shows the switchboard gallery which is 14 feet wide and extends the entire length of the room. It will also be observed that there is a rolling door for each room; these were supplied by the A. B. Ormsby Co., Toronto.

Transformers and Switches

The plant receives 3 phase 25 cycle power at 2200 volt through an overhead line from the Hydro sub-station a short distance from the company's power house. The line enters the building at the transformer room. The system is protected by a set of Westinghouse type AK electrolytic lightning arresters. These are mounted on a gallery about 25 ft. from the floor. Disconnecting switches are also here provided for cutting off the entire supply. On the main floor of this room there are installed four 150 KVA. O. I. S. C. transformers, 2200/550 volts. Three of these are ordinarily used connected in delta, the fourth being a spare unit which can take the place of either of the others in case of breakdown. On a pipe structure immediately above the transformers there is mounted a set of disconnecting switches for both the high and low tension side of each transformer, and, over the spare transformer, these switches are double throw and connected in such a manner that the spare transformer can be put into service by simply closing the proper switches.

FIG. 9. MOTOR-GENERATOR ROOM WITH SWITCHBOARD GALLERY AND 550-VOLT SWITCH STRUCTURE UNDERNEATH THE D.C. BOARD AT FAR END.

Directly opposite the transformers in the same room is located the 2200 volt switch structure. This consists of the usual pipe framework with a laminated copper bus running along the top. Beneath this are mounted all the electrically operated remote controlled oil switches which control the various outgoing 2200 volt feeders to the factory, and also the primary of the transformer bank. Between the oil switches and the bus there is a set of disconnecting switches on each circuit, and at the end

of the structure the main incoming line switch, which is also electrically operated, is located, likewise the disconnecting switches.

There is also mounted adjacent to this structure another set of Westinghouse type AK electrolytic lightning arresters which are connected directly to the 2200 volt bus. All series transformers are connected in on the load side of the circuit breakers and immediately above the potheads on the end of the lead covered cables. The cables pass from here down through the floor into the underground duct system, which will be spoken of later.

A.C. and D.C. Switchboards

Next to the transformer room there is the motor-generator room which also contains the operating gallery on which is mounted the nine-panel a.c. switchboard, and five panel d.c. switchboard, both of Westinghouse manufacture. The material used on both these switchboards is black marine slate, having a total height of 7 ft. 6 ins., composed of one panel 25 ins. high, and another 5 ft. 5 ins. high, supported on angle iron frame work. The width of the panel varies according to the amount of apparatus mounted thereon, but none are less than 20 ins. wide. The thickness of the slate is 2 ins. and each panel has the edges of the slate beveled. The a.c. board controls all the 2200 and 550 volt circuits and the incoming line switch. As all these switches are remote controlled and electrically operated, only the controls and the indicating lamps are mounted directly on the switchboard.

A totalizing panel is provided which contains a Westinghouse graphic recording wattmeter, graphic recording frequency meter, graphic recording power factor meter, and graphic recording voltmeter. At the left-hand end of this board, on a swinging bracket, are mounted a voltmeter and an indicating power factor meter, the voltmeter being arranged so that it can be plugged on to any one of the three phases, and the power factor meter arranged so that by inserting a plug into a receptacle provided on each one of the feeders, the power factor of that load may be read. The relays protecting all the circuits on this board are Westinghouse type B shunt trip, and are located on brackets at the back of the board.

Motor Generator and Connections

In a plant of this kind it was found advisable to use direct current motors on the calenders, and for supplying this load there has been installed a Canadian Westinghouse motor-generator set. This is a three-bearing machine, consisting of a 510 h.p., self-starting synchronous motor, 3 phase 25 cycle 2200 volt, direct connected to, and on a common bedplate with, a 350 k.w. 230 volt 3-wire d.c. generator. The speed of the set is 750 r.p.m., and there is a 6 k.w. exciter mounted on the end of the shaft for exciting the synchronous motor. Balance coils are provided capable of carrying unbalanced load up to 50 per cent. of the generator capacity. The d.c. leads from the generator are carried through conduit up to the back of the d.c. switchboard on the gallery, where the usual switches and circuit breakers are provided.

The starting panel for the synchronous motor forms part of the d.c. switchboard. On it are mounted two controllers and three signal lamps, which work in conjunction with three electrically operated oil switches on the switch structure immediately below the gallery. This panel also mounts relays, a field switch, and two ammeters, one in the field circuit of the synchronous motor, and the other in the primary circuit. To the right of the d.c. generator panel there are two d.c. feeder panels consisting of 800 amp. carbon circuit breakers, ammeters and knife switches. The last panel on this switchboard is for controlling a 25 k.w., 125 volt, General Electric Co., turbo-generator, which is used for emergency lighting in case the power should be off. On a swinging bracket at the right-hand end there is mounted a 300 volt d.c. voltmeter.

FIG. 10. VIEW OF TRANSFORMER ROOM. 2,200-VOLT SWITCH STRUCTURE ON THE RIGHT AND TRANSFORMERS ON THE LEFT.

Switch Structure Details

The switch structure, which is mentioned as being underneath the switchboard gallery, in addition to mounting the oil switches for the synchronous motor, also has mounted on it the 550 volt electrically operated oil switches. These are fed from an overhead bus through disconnecting switches, and the entire structure is very similar to the 2200 volt structure in the transformer room. Altogether there is a total of 18, either 2200 volt or 550 volt Westinghouse type B electrically operated remote controlled oil switches in this plant.

By the use of these switches the Goodyear Co. have been able to concentrate all their controllers on a comparatively small switchboard which would not have been possible had they mounted the oil switches directly behind the switchboard panels as is so often done in installations of this kind. On all parts of the electrical equipment there has been provided ample room for future extension. Both switch structures can be extended a considerable distance; and there is room for two more motor-generator sets as well. Both a.c. and d.c. switchboards can be extended in either direction, and the a.c. switchboard is even now provided with two blank panels which can be equipped with instruments and controllers when the occasion arises.

All the cables leaving the power house are three-conductor, cambric insulated, and lead covered. These pass through an underground duct system consisting of about sixty 3-inch fibre conduits, to a brick cable vault located at about the centre of the factory building in the basement. From here the various cables are distributed. The 2200 volt cables to the large motors run direct through in iron conduits. The other circuits, consisting of 550 volt power and the direct current circuits change to rubber insulated braid covered cable, run in iron conduits, to the various machines or distributing points.

Lighting Details

The lighting of the factory is taken care of by three 35 k.w. oil insulated single phase transformers, located in a sub-station in the basement of the factory. In this room there is also a 2200

FIG. 11. BACK OF D.C. SWITCHBOARD SHOWING ARRANGEMENT OF BUSES.

volt oil switch for controlling the primary, and a number of knife switches and fuses for controlling the secondary circuits. This apparatus is mounted on two black marine slate panels of standard height and dimensions. A 6-wire cable bus is run from the low tension side of the transformers over the top of the switchboard panels, and connected to the laminated copper bus which distributes power to the various lighting circuits.

Factory Motors and Equipment

The various lines of mixing mills, warming up mills and washing mills in the factory are driven by Westinghouse type CCL squirrel cage induction motors, 3 phase, 25 cycle, 2200 volt, 500 r.p.m., 2-bearing pedestal type, there being three of 400 h.p., one of 300 h.p., and one of 200 h.p. These are each direct coupled to a reducing gear by means of a Cutler-Hammer magnetic clutch coupling, which in turn is connected with a safety switch located over each mill, so that in case of accident the operator may by tripping the safety switch disengage the magnetic coupling which operation also sets two magnetic brakes, one connected to the motor shaft, and the other to the reducing gear shaft, and also opens the motor switch, so that the whole outfit is immediately brought to a standstill.

The starting panels for each of these large motors are in each case located just a few feet away from the motor. In addition to a double-throw starting oil switch for the motor, and a double-throw oil switch for reversing the motor in case of necessity, there is also mounted the relay apparatus for controlling the brakes and clutch couplings. An ammeter connected in the primary circuit of the motor completes the equipment of these panels. The apparatus at the back of the panels is neatly enclosed in a steel housing, with a ventilator at the top. The auto-transformers and cable terminals, etc., are also mounted within this housing.

For driving calenders there are provided three 75 h.p. variable speed direct current motors. These are of steel frame pedestal type construction, and are equipped with interpoles. They are operated from the 3-wire 115-230 V. system and have a range of speed from 375 to 750 r.p.m. The various speeds on the lower range are obtained by connecting the motor to the 115 volt leads, and by using control. The higher speeds are obtained by connecting the motor to the 230 volt leads, and also using field control. The control panels, which are of Cutler-Hammer manufacture, are mounted directly beside the calendars, and are operated from a master controller mounted right on the calender frame.

In addition to the equipment mentioned above, there have been installed at various points in the factory, a large number of smaller sized induction motors, mostly of Canadian Westinghouse manufacture. Some of these are started with the Westinghouse type K auto-starters and some of them in the smaller sizes are provided with a Westinghouse type H oil circuit breaker.

In case of the failure of supply from the Hydro, the 25 kw. turbo generator is connected through 3 pole d.t. automatic switches to feeders on all floors to supply necessary lighting to complete any operations requiring immediate attention such as vulcanizing, etc.

The main equipment was supplied and installed by the Canadian Westinghouse Co., Hamilton, Ont.; the bus bar equipment by the General Devices & Fitting Co.; the wires and cable by the Standard Underground Cable Co., Hamilton, and the Northern Electric Co., Montreal. The wiring for lighting and 550 volt power was installed by G. J. Beattie, Toronto.

Electric Lighting Installation

The electric installation for the lighting of the factory is fed from the three 40-k.w. single-phase transformers already mentioned, these being connected in double delta to obtain a 3-wire, 230-115 volt, single-phase system.

From the switchboard in basement sub-station, two sets of three wire mains run to each floor in conduit, changing into open wire at second bay on either side of the centre of the building. The three wires run the entire length of the building on E. E. E. bus insulators mounted on beam clamps to lower web of each I beam, and slack is taken up by strain insulator and J bolts at each end. On the mains in the basement is the only place where conduit has been used, junction boxes being placed at short intervals to allow of alterations and additions.

The circuits are fed from 4-circuit, 2-wire fuse cabinets placed about 10 ft. from the ground on the columns (to prevent unauthorized persons tampering with fuses). From the cabinets the branch circuits are run in conduit to centre of distribution of each circuit, changing into cleat wiring, split knobs mounted on Universal beam clamps, being used to support the wiring as it passes across the I beam from bay to bay; this method of wiring gives a very flexible arrangement, allowing alteration of position of lights to be made quickly and economically.

Nitrogen lamps of 100 watts, with Abolite shades and shock absorbers, have been used in basement, second, third and fourth floors, while 200-watt nitrogen lamps, with suitable shades, are in-

FIG. 12. EXTERIOR VIEW OF FACTORY AND POWER HOUSE, WEST END.

stalled on first floor, which has a high ceiling. General illumination has been used mostly throughout the factory, except in spaces set apart for tire manufacture, etc., in which group lighting suitable to the various operations has been installed.

In the power house, owing to the height of the roof, 500-watt nitrogen lamps, with distributing shades, are utilized, with the addition of bracket lights around walls in generator room, pump room, and boiler room. Approximately 24 miles of rubber-covered wire and cable have been installed, together with seven hundred 100-watt, one hundred 200-watt, and twenty-five 500-watt nitrogen lamps of Westinghouse manufacture.

Properties of Crude Rubber

In passing it may be of interest to refer briefly to the raw material from which tires and other rubber products are made. While tires are not made entirely of rubber, this material forms the basis of their manufacture. Crude rubber is imported from tropical regions of Asia, Africa, and America. Most of it is obtained primarily in the form of an aqueous emulsion or latex secreted by the bark of certain trees. This must not be confused with the sap inside the tree, as it is obtained by cutting the bark only. From this latex the rubber is won as a tenacious, springy self-adhesive mass by various methods of coagulation. The rubber produced in America and Africa is usually more or less moist, dirty and inhomogeneous. Asiatic rubber comes from Ceylon, Malay Peninsula and Archipelago and India. These rubbers are clean and dry as the preparation is more thorough. The former are known as "Wild" rubbers and the latter as "Plantation" rubbers.

Wild rubber is shipped in the form of sheets, blocks or slabs, and balls. Each kind of rubber has a characteristic and a more or less strong odor. Wild rubbers are usually soiled with vegetable refuse, earthy impurities and contain considerable moisture. In the manufacture of rubber goods, the crude wild rubber is first washed and dried and takes the form of corrugated sheets or crepes which are light grey when wet and dark grey or brown when dry. Plantation rubbers are produced on scientific lines and do not as a rule require washing at the factory. The rubbers are shipped in the form of sheets, crepes or translucent blocks. The color is mostly light yellow. Smoke sheet and crepe rubbers have a dark red color and a pronounced smoky smell.

Vulcanizing

Rubber must be cured or vulcanized to produce tires and kindred goods; in fact all rubber must undergo some kind of curing process before the products can be used for commercial purposes. Heat cured rubber goods are made by compounding rubber, sulphur, and other materials required to give the product the desired properties, and vulcanizing the mixture at a comparatively low temperature as will be noted later. Fabric is used in the manufacture of tires, in combination with the rubber and other materials. After curing, the goods retain their constituents practically unaltered except that part of the sulphur combines with the rubber. Sulphur, which is the vulcanizing agent, is next to the rubber itself the most important raw material used. When mixed with sulphur and heated to a temperature above 250 degrees Fah. the raw rubber enters into chemical combination with the sulphur and becomes vulcanized. The vulcanized rubber differs from the uncured product in that it is stronger mechanically, is insoluble in rubber solvents, is practically indifferent to changes of temperature within fairly wide limits and is a more stable substance generally.

Tire Manufacture—Compounding

The preliminary operation begins at the east end of the plant main floor where the compounding department is located. The basement is utilized as a storage for plant supplies, raw material, etc. In the compounding department, the raw materials which are to be incorporated with the crude rubber are carefully weighed along with the latter and placed in steel boxes preparatory to being taken to the mill room. In this department there are two rows of bins containing the various compounds, the bins being charged from the mezzanine floor above. The proportions of compounds and quality of crude rubber used are regulated according to carefully drawn specifications which are adhered to until the tire is ready for shipping. As the proportions of these compounds have a direct relation to the vulcanizing or curing process, it follows that the mixture must be pre-determined at this stage of manufacture, hence the necessity of a specification. The specifications are drawn up by the laboratory staff and cover all processes, as well as the composition and quality of all the materials entering into the finished goods.

Washing Rubber

As already stated the crude rubber is either "wild" rubber or comes from the plantations in a more or less clean condition. The Goodyear plant is laid out to take care of either of these varieties. The "Wild" or dirty rubber has to be washed and dried before being mixed in the mill room. Before being washed the rubber is passed through a cracker or masticating machine. This machine consists of a strong cast iron frame supporting two steel rolls having very coarse teeth which tear and shred the rubber. A stream of water plays on the rubber constantly, washing out the coarser dirt and foreign matter, preparing the rubber for its final washing.

The washing machine is located in line with the masticator and is operated by the same motor. The washing machine has two groved or corrugated rollers and the process consists of squeezing the raw rubber repeatedly through these rollers under a constant shower of cold water. The batch is worked up into a sheet of sodden crepe which is passed through several times, the rollers being screwed up gradually into closer contact until the wash water flows off colorless and free from suspended matter. The washed crepe is eventually hung up to drain for an hour or two and is then ready for drying which is done in specially equipped drying rooms or in vacuum dryers. The difference in weight between the original batch of crude rubber and the fully dried washed crepe, calculated as a percentage of the former, represents the washing loss.

Mixing Operation

From this point onwards the processes are identically the same for both plantation and wild rubber. Mixing is done on a machine consisting of two horizontal rolls which masticate rubber and incorporate it into sulphur and other necessary materials. The mixer is motor-driven, the speed of the shaft being reduced by a Falk transmission. There is a safety clutch installed in the line controlled electrically from a safety device in front of each roll to prevent the operator's hands being drawn between the rolls. The rolls which are hollow are equipped with piping for warming them up before the mill starts and for cooling the rolls during the mixing operation. One roll revolves at a slower speed than the other in order to mix the rubber properly. This causes friction and heat and the cooling system is necessary. The rubber is passed through the rolls several times until all the materials are thoroughly incorporated in the mass. When the rubber leaves the rolls finally it is in the form of a flat sheet. These sheets are powdered to prevent them from sticking to one another and are laid on portable racks ready for the calendar. All the mixing mills installed were designed by the Goodyear Company.

Rubber Coating Fabric

Each sheet of rubber when placed on the racks is tagged. Before going to the calendar the sheets are weighed, the weights being systematically recorded. The sheets are then moved along to a mixing mill to be warmed up preparatory to being calendared. The calendars are specially designed machines having three rolls, fitted with a cooling system, similar to the mixing mills. The calendars have electrically controlled safety devices for preventing accidents. In the calendars the fabric is skin-coated with rubber, the friction caused by the rollers presses the rubber into the fabric. The rollers revolve at odd or even speed according to the work being put through; the speed depending upon the quality of stock. The calendared stock which is used for building up tires is sent up to the second floor for further treatment. The fabric before being used on the calendar is ironed and dried out on a special machine for this purpose called an ironer. This machine consists of twelve 60-inch rolls in two stands, the rolls being steam-heated. After the fabric has been ironed it is placed in a steam-heated oven and remains there until wanted at the calendars.

Stock Preparation Department

On the second floor at the east end is the stock preparation department which as its name indicates is the place where the fabric, treads and beads stock are made up into such form as can be used in the building up of the tire. The frictioned or skin-coated fabric is cut into strips and also cut into lengths on a bias cutter. There is also a machine for cutting the fabric into narrow strips. After being cut, the fabric is assembled in rolls, according to width, ready for use on the tire building machines.

At the same end of the floor is the department where the tread and bead stock is made. The stock for the tire treads is first warmed up in a mill, the same type as used for mixing. The tread stock is cut up into short lengths, rolled up by hand and put into a "Royle" tubing machine. The machine is driven by a Can. Westinghouse 25 h.p. motor through "Falk" transmission. The tubing machine has a cooling system. The stock which is forced through the machine by means of a screw comes out in strips and is then cut into lengths. There is another machine of the same type, only a smaller size installed for the same purpose. This machine is driven by a 15 h.p. motor. There is another machine nearby for insulating bead wire for detachable tires. The bead stock for clincher tires is also made in the stock preparation department.

The rubber enters the machine in round strips and comes out in a "V" section. The stock is then pressed on a steam-heated press to the required section. The bead stock, which at this stage is in long lengths, is now put through a wrapping machine, being first cemented before being wrapped in frictional fabric. The bead stock is afterwards cut to length and then spliced.

In another section of this department the detachable tire wire beads are assembled on revolving tables and then finished in a hydraulic press. Adjoining this section is the department where the lengths of fabric are spliced and rolled.

Building Up Department

About the center of this floor is the building department where the tire carcasses are built up previous to being cured. There are a number of machines in this department specially designed for this particular purpose by company. The machine consists primarily of a stand to hold a number of spools of fabric, a revolving form to build the tire on and set of small rollers for pressing the layers of fabric together. The fabric is laid on in strips lengthways, the thickness of material varying according to the size of tire and regulated by specification. The beads are built in with the tire carcass. The tires are then finished building where strips of rubber are applied to form the outside of the carcass. For this operation the form on which the tire is built up is recured on a stand with a ball bearing fixture which can be placed in any position and the strips of rubber and fabric are laid out on a table. These strips are made of varying widths and gauge to suit any size of tire.

Curing or Vulcanizing Department

The curing process is a very important one as the quality of tire depends largely upon a proper vulcanization of the rubber. The time and temperature vary according to the compound in the stock and for this reason no definite figures can be given. It is sufficient to say, however, that the temperatures are carefully controlled. In this department, which is situated at the west end of the second floor, are located the heaters or vulcanizers. A noteworthy feature about this installation is that the heaters are not placed in a pit, which is usually the case, but are so arranged that the heaters and piping are easily accessible from the floor below.

The accompanying illustration shows the top of the heaters, the rest being below the floor of this department. The steam piping connecting the heaters is suspended from the ceiling of the main floor, that is underneath the second floor. These heaters are not only used for curing the tire carcasses but are also presses. There is a hydraulic ram in each heater, the top of the ram being in the form of a table upon which are placed the moulds containing the tires. Each heater will hold about 25 moulds, the ram falling as the moulds are being placed in the heater. When full the cover of the heater is screwed on and the steam turned on. The pressure is applied to the ram which presses the tire to completely fill the mould thus making the tire a homogeneous mass. At the same time the company's name and size of tire are moulded on the side of the carcass.

When the cure is completed the moulds are lifted out by chain blocks suspended on overhead tracks between the two rows of heaters; the ram rising as the moulds are taken out. The moulds are laid on steel racks and the tires taken out. Each heater is equipped with valves for controlling the steam, a "Bristol" recording thermometer and a mercury thermometer. This department is well ventilated having a monitor roof over each side, with ventilators operated from the floor by hand, in addition to the ventilators in the window sash.

Tread Department

It will be necessary at this juncture to take up the manufacture of the bond or tread which is done on the third floor and leave the tire proper for the moment, for the tread is applied to the tire before the final curing process. At this stage the tread is in the form of a strip and must be pressed to the desired form and pattern. It is at this operation that the well known Goodyear "Diamond" pattern is formed on the tread. While the hand is being pressed heat is applied which cures or vulcanizes the tread at one operation. The presses are operated by hydraulic power.

Before the vulcanized tread is applied to the tire, both tread and tire are roughed to make them stick together more readily. The tires are roughed by hand but the treads are done on a special machine designed by the company. The next process consists of cementing the tire, the cement being applied by hand while the tire revolves. The cement is carried around from one machine to another in a Bowser portable tank. When the cement has dried, the band is laid on the tire, and pressed on in a tread ing machine. During this process the tire revolves while the two rollers are pressing the tread on.

Final Curing

The tread is now firmly attached to the tire. The next process is the second or final cure. The tires are first wrapped with canvas on a special machine for this purpose and hung on a truck having two long arms. The trucks are wheeled into the heaters which are horizontal and remain there for a predetermined period the heaters being heated by steam and held at a certain fixed temperature. This process cures the complete tire. After the tires are taken out of the heaters the wrapping is removed and the tires taken over to the lining table. There is a special machine for rewrapping the canvas on to spools.

Final Tire Operations

The next process is the finish trim. The inside edge of the tire at the bead is trimmed up, the inside of the tire coated with a preparation which reduces the amount of friction between the tire and inner tube and the tires moved over to a long table where the final inspection takes place. The tires are now finished and ready for shipping. The tire storage occupies a considerable part of the east end of the third floor and is equipped with long steel racks where the tires are stored according to sizes, etc.

Tubes and Accessories Departments

The fourth or top floor is devoted to the manufacture of tubes and accessories while there is also a tire repair department. These departments occupy nearly three-quarters of the floor space while the rest is utilized for office and laboratory, etc., and also a cafeteria. The office and cafeteria are only here temporarily and will be removed when the space is required for manufacturing purposes.

The tube stock is prepared in the same way as tire stock, that is, it passes through the mixers and calendars. On the calendars the tube stock is sheeted out to very thin gauge and carefully inspected. The sheets are rolled up carefully on top of each other to make the desired thickness of finished tube. The sheets are then cut to the required width, the edges skived, cemented and joined together thus making the inner tube. These operations are all done with specially designed equipment. The tube lengths are then weighed, laid on a shelf and cured.

Before being cured the tube is pulled over a steel tube mandril by hand, compressed air being used to facilitate the operation. The tube is then straight wrapped with a long sheet of linen on a bench and then taken to a machine to be cross wrapped with long linen strips. For this operation the tube is held in a machine, and revolved while the operator wraps the linen round. The wrapping is for the purpose of protecting

the tube while being cured. The tubes are then piled on a truck and run into an oven where they are cured or vulcanized. When cured the cross wrapping is taken off on a machine similar to the wrapping machine. The tubes are then stripped off the steel tube by hand, compressed air being also used. The rubber tubes are then hung on a rack of special design for this purpose.

The tubes then go to a punching machine to have the air valve hole punched after which the ends are skived on a special machine. The valve stem is then put in, and the tube taken over to a machine to be spliced. In this department is a machine known as a "Clicking" machine for stamping patches out of fabric. This completes the tube manufacturing. As in the case of the tires, the above description is of necessity abbreviated as an explanation of every detail in the process of manufacturing tubes would take up more space than is available for this article. It is also for the most part specialized work and involves a number of features not necessarily known in the trade.

Tire Repair Departments

A well equipped and up-to-date plant has been installed for repairing tires and retreading, etc. This plant is located on the fourth floor.

Cement Department.

The company manufactures cement for use in the factory and also for the trade. Owing to the inflammable nature of the ingredients used for making the cement, the manufacturing is carried on in a separate building situated on the north side of the main factory building. The building is of brick construction and fireproof, being 33 feet by 56 feet. It is divided into two sections, the mixing room and storage. Mechanical mixers are installed for mixing the various ingredients. The cement is used for manufacturing and repairing tires and also in the manufacture of boots and shoes, etc.

Spreading Department

Adjoining the cement house and also in a separate building is the spreading department. This building is also of brick construction and is 30 feet by 30 feet and one storey high. In this department the company is equipped to manufacture anything in the line of waterproofing material and also balloon and aeroplane fabrics, etc.

Cord Tires

The company has installed a plant for manufacturing cord tires, being the first plant of its kind to be operated in Canada. The process of manufacturing the cord tire is somewhat similar to that for other tires except that it requires special equipment. It is a marked improvement over fabric tires. It is hand made and is built up of cords placed loosely side by side in diagonal layers, without cross weave. Cord tires are made in all standard sizes with all-weather or ribbed treads.

General Features

Both the factory and power house were designed by the engineering staff of the Goodyear Company. F. H. Breor, chief mechanical engineer, supervised the construction work. The construction of the factory is in accordance with the latest practice, the best materials only being used and no expense being spared in the carrying out of the work. Tire manufacturing is to a large extent a specializied business and much of the machinery used is thus of special design for the particular process where it is used. The company has developed and perfected a number of machines and processes which are used in plant. The location of the various departments and equipment used was determined after a full consideration of the requirements of the situation and in accordance with the experience gained during a number of years in the manufacture of tires. The layout of the plant thus represents the embodiment of all this experience.

Although the factory is not yet operating at capacity, the layout of the plant will not be affected as the output increases. In other words the production of tires can be increased to the maximum capacity without necessitating any change in location of machinery or in routing. There is room in each department for expansion up to a certain point; the floor space although well occupied is not crowded. Wonderful progress has been made in getting the plant to its present state of efficiency, considering that the factory has only been operating no more than three months. It speaks well for the organizing ability of the high officials backed by the efforts of the staff that so much has been accomplished in so short a time.

The output of the factory when operating its full capacity will be approximately 3,000 tires and tubes. The tires are of standard quality and carry the "Goodyear" trade name with the "Diamond" or "All-Weather" tread and are of the same quality as are made at Akron, Ohio, where the American end of the company has a very large factory.

It has already been stated that the company does not manufacture mechanical rubber goods at New Toronto, the factory at Bowmanville being now devoted exclusively to this end of the business. The company makes an extensive line of mechanical rubber goods including hose for all purposes, particularly fire hose, various grades of rubber belting, packings, gaskets, pump valves and rubber moulded goods, etc. The basic material for these goods, the friction fabric of which they are made, and the initial process including vulcanizing are the same for mechanical rubber goods as for tires, the final operations being of course somewhat different.

Sales Offices and Executive

The head office of the Goodyear Company is located at the corner of Richmond and Simcoe Streets, Toronto, while the company maintains twelve branch sales offices in the principal cities of the Dominion from Halifax to Vancouver. The president of the company F. A. Seiberling, is the only executive officer not located in Toronto, being at Akron, Ohio. The other officials are R. P. D. Graham, vice-president; C. H. Carlisle, treasurer and general manager; C. J. Oille, assistant treasurer and secretary, and H. C. Lower, general sales manager. Mr. Carlisle came over from the United States in 1910 when the Goodyear Company bought out the Durham Rubber Co. of Bowmanville. He was at that time secretary-treasurer, but since 1910 has had full management of the company. The Bowmanville plant since that date has of course been considerably extended. The principal officials at the New Toronto factory are as follows: S. H. Koken, superintendent; F. H. Breor, chief engineer, and A. R. Stannah, master mechanic.

Contractors

The principal contractors for the construction and equipment of the factory include the following: General contractors, the Dominion Construction Co., Toronto; heating system and piping, Bennett & Wright, Ltd., Toronto; electrical equipment, Canadian Westinghouse Co., Hamilton; electric wiring, George J. Beatty, Toronto; sash, Steel & Radiation Co., Toronto; waterproofing, the Carmichael Waterproofing Co., Toronto; glazing, Britannia Plate Glass Co., Toronto; glass, Pilkington Bros., Toronto; plumbing, Keiths Ltd., Toronto; sprinkler system, H. G. Vogel Co., Buffalo, N. Y.; mastic floors, Construction Supply Co., Toronto.

STEEL SUPPLY SHORTAGE

THE present supply of iron and also of steel in the United States is falling a long way short of meeting national requirements and the problem of how to increase production which must be successfully solved is by no means a simple one. As things stand to-day, blast furnaces in all iron producing sections of the country have fallen seriously behind in the fulfillment of their contracts with consumers, and instead of gaining are steadily losing ground.

The aggregate production is holding up, it is true. In fact, last month showed a slight gain over October, but when measured by demand it was pitifully small. The outturn for November was 3,205,794, tons, or 106,869 tons a day, as compared with 3,305,038 tons in October, or 106,550 tons a day. The increase in the average daily production as shown by the figures was only 309 tons, while for the entire month there was an actual decrease of 97,244 tons. At the November rate the production for the year would be 38,400, 000 tons, as against a total production during 1916 of 39,-400.000.

There are no reliable figures yet available, but it is fairly safe to assume that the demand for iron during the current year has increased at least 10 per cent. over 1916. The result has been that there is not a ton of stock to-day in sellers' hands available for immediate delivery. As an illustration of the general situation, the American Warrant Company has cancelled its last warrant, which signifies that all reserve supply is completely exhausted.

Duty Trials on Two 24-Million Gallon Pumping Units

Contributed

The pumping engines whose performances are recorded in the following report are driven by De Laval steam turbines, and form part of the installation at the Main Pumping Station, Toronto Waterworks. The duty trials were made March 6 and 8, 1917, by Robert W. Angus, professor of Mechanical Engineering, University of Toronto.

ALL of the water used by the City of Toronto is pumped through the Main Pumping Station at the foot of John Street. This station is equipped with a number of steam driven pumps and also a number of electrically driven units, the latter receiving electric current from the general city supply. In so far as the electrically driven units can be operated without raising the city's power peak, they are kept in service, but whenever the electrical operator finds that the peak is being approached, he has one or more electrical pumps stopped and then the delivery pressure of the station may slightly decrease while a steam pump is being brought into service, but, on the whole, these variations in pressure and in supply are not noticeable in the city.

Description of the Units

Some few years ago it was decided to increase the pumping capacity of the Main Station, and, with this in view, a new pump room with adjacent boiler room was built. The pump room now contains five pumping units, two of which are driven by induction motors, and three of which have been built by the De Laval Company, and are driven by steam turbines. It is with two of the latter pumps that the report deals.

Each unit consists of a De Laval steam turbine connected through a reduction gear to a pair of centrifugal pumps, which are connected so as to work in series.

The units are exact duplicates.

The turbines are of standard De Laval construction, type 1,600 T. D., for steam pressure of 150 pounds, and a vacuum of 29 inches, the normal speed being 3,430 revolutions per minute. Each is direct-coupled to a speed reduction gear having a ratio of 33 to 197, so that the pump shaft rotates at normal speed of 575 revolutions per minute.

The steam supply pipe is 4½ inches, with 36-inch exhaust to a standard Wheeler surface condenser, so placed that all the water delivered by the unit passes through it as cooling water before reaching the main pumps.

The vacuum pump is a 20-inch x 40-inch Rotrex pump built by the C. H. Wheeler Company, and is direct connected to a 7-inch x 7-inch engine designed for a normal speed of 200 revolutions per minute, but which ran at a much lower speed during the trials. The exhaust from this engine is delivered back into the steam turbine somewhere near the middle stage, and is made use of in doing work there.

The boiler feed pump is chain driven from the pump shaft. It is a Goulds single acting triplex plunger pump with plungers 3½-inch diameter and 6-inch stroke, and in one of the units the crank shaft driving the plungers turns at about 47 revolutions per minute, a speed which is too low to supply the necessary feed to the boiler for this pumping unit; in the other unit the speed is 66 revolutions per minute, which is satisfactory.

There are two single stage double suction pumps on each unit, the two pumps being piped together in series. There are no outside guide vanes, but the castings are of the volute form and the pumps run very quietly. The name plate states that the pump is of Type P-24, and is designed for a total head of 250 feet, and a discharge of 20,000 U.S. gallons per minute (which is equivalent to 24,000,000 Imp. gallons per 24 hours) at a speed of 575 revolutions per minute.

The water piping begins with a 42,-inch suction, which is the size of the inlet to the condenser. At the condenser outlet the diameter is reduced to 36 inches and this is again reduced to 24 inches where it enters the pump. The series piping between the pumps is 30 inches, being reduced to 24 inches at the point of connection with each pump. To the discharge end of the pump a 24-inch x 36-inch tapering enlarger has been

GENERAL VIEW OF PUMPING WITH UNITS UNDER TEST IN FOREGROUND.

attached to connect with the 36-inch discharge main. The inlet and outlet openings on all the pumps are 24-inch diameter.

The pump impellers are of bronze.

The Duty Trials

The duty trials on the machines were run on March 6th and 8th, 1917, respectively, and in order to see that the conditions were uniform before the tests began, the machines were run for at least an hour under full load immediately preceding the duty trial.

The boiler fires were properly cleaned, and everything put in as good condition as possible to insure uniformity, but some slight variations naturally occurred. It was necessary to run the trial during the daytime, owing to the demand for water in the city, and therefore an effort was made to start as near seven o'clock in the morning as possible, although in both cases the trials did not begin till nearly an hour later.

The city's electrical power peak occurred shortly after the trial began in each case, and the electrical pumps were therefore shut down, causing a heavy draught on the pump under test. There was a consequent decrease in pressure, but as the discharge increased at the same time, the load on the steam turbine driving the pump did not vary greatly. Throttling of the pump discharge was temporarily resorted to, in order to prevent undue fluctuations, and another steam pumping unit elsewhere in the station was put into service as quickly as possible, but the extra draught of steam from the boilers caused some slight variations in steam pressure.

All of these variations, however, were of short duration and were productive of but slight inconstancy in the general conditions, and the machines were given exceptionally steady loads during their entire trials.

Conditions Governing the Trials

In the contract dated August 14th, 1914, the conditions governing the conduct of the duty trials are given, and the following clauses referring thereto are copied here for reference:

"54. Each turbine shall have sufficient power capacity when connected by flexible or other approved coupling to the centrifugal pump to raise from the suction conduit directly into the pipe system of the city not less than 24 million Imperial gallons of water in 24 hours, against a pressure difference of 107 pounds per square inch between suction and discharge mains, the pressures to be measured at approximately the same level.

"57. The turbine to be designed for speed not in excess of 4,000 revolutions per minute, and the centrifugal pump to to be operated at speed not exceeding 600 revolutions per minute, with provision for a ten per cent. (10%) increase in speed, if necessary.

"58. The pumping capacity of the unit shall be determined by Venturi meter measurement, and if the capacity of the unit, when running the pump at a speed not in excess of 600 revolutions per minute, and a turbine speed not exceeding 4,000 revolutions per minute, is less than 24 million Imperial gallons, the Commissioner may deduct from the amount to be paid to the contractor two and one-half per cent. (2½%) of the contract price for each one per cent. (1%) less than the specified capacity, at the specified pressure, and pro rata for fractional parts.

"If the capacity as shown by the official trial of the unit does not reach 92% of the specified capacity, the Commissioner may, at his option, reject the unit, and in case of such rejections the contractor shall return all moneys paid him on account, and shall, without compensation, allow the unit to remain in the service of the city and under the control of the commissioner for such reasonable time as may be required to install a new unit.

"The steam turbine driven unit shall perform a duty of not less than one hundred and twenty million (120,000,000) foot pounds for each one thousand (1,000) pounds of steam containing less than 1½% of entrained water, as determined by throttling calorimeter measurements, used by the engine and any auxiliary pumps supplied by the contractor and operated during the duty trial, when pumping not less than 24 million (24,000,000) Imperial gallons in 24 hours.

"In computing the duty, the work performed by the unit shall be based upon Venturi meter measurement. The head for computing the duty shall be that shown by an accurate pressure gauge attached to the discharge main at a point inside the engine room and beyond the last pump, less the reading shown by a gauge attached to the supply conduit at or near entrance to pumps, an allowance being made for any difference in the level of the gauges. No allowance shall be made for friction of water between the gauge points, between which shall be situated the complete machine as supplied by the contractor.

"In computing the duty, the total steam used, including that used by jackets, air pumps, air compressor, boiler feed pump and any other auxiliary pumps, shall be charged up to the engine. No allowance shall be made for any heat returned to the boilers derived from the exhaust steam from the turbine or from any auxiliary.

"After the unit has been in successful operation for sixty (60) days, a duty trial of 24 hours' duration shall be made. The unit shall be operated continuously at its rated capacity, against a pressure difference of 107 pounds per square inch as above specified, and shall be supplied with steam of not more than 150 pounds per square inch, by gauge, at the boiler, and containing not more than 1½% of entrained moisture.

"During the trial the unit shall be operated by the regular engineers of the station, at the speed and pressures specified, but otherwise shall be under the control of the contractor. The trial shall be conducted by the Commissioner, or persons appointed by him, in the presence of a representative of the contractor. The city shall pay all expenses of the trial, except that the contractor shall pay his own men.

"If the duty shown by the official trial of the steam turbine driven unit shall be less than 120,000,000 foot pounds, the Commissioner shall deduct from the amount to be paid the contractor the sum of $2,500 for each 1,000,000 foot pounds unperformed below 120,000,000 foot pounds, and pro rata for fractional parts down to 115,000,000 foot pounds.

"If the duty shown by the official trial of the steam turbine driven unit shall be less than 115,000,000 foot pounds, the Commissioner may, at his option, reject the unit; and in case of such rejection, the contractor shall return all moneys paid to him on account, and shall, without compensation, allow the unit to remain in the service and under the control of the Commissioner for such reasonable time as may be required to install a new unit.

"If the duty as shown by the official trial of the engine exceeds 120,000,000

VIEW OF UNITS UNDER TEST FROM OPPOSITE DIRECTION.

foot pounds, the city shall pay to the contractor the sum of $1,500 for each 1,000,000 foot pounds above the stipulated duty, and pro rata for fractional parts, but the bonus shall not exceed $7,500.

"59. While the duty specified for the steam turbine driven unit is 120 million foot pounds, tenderers are requested to state any higher duty they are prepared to guarantee, and any higher duty guaranteed, together with the contractor's ability to fulfil same, in the opinion of the Commissioner, will form a factor in the awarding of the contract. Should the contractors guarantee a duty in excess of that specified, when using saturated steam containing not more than 1½% of entrained moisture, the duty guaranteed will be substituted for this amount, and for each one million (1,000,000) foot pounds in excess of the guarantee the corporation shall pay to the contractor the sum of fifteen hundred dollars ($1,500), and pro rata for fractional parts, but the total bonus shall not exceed seven thousand five hundred dollars ($7,500). Should the duty as shown by the official trials be less than the guarantee the Commissioner shall deduct from the amount paid to the contractor the sum of two thousand five hundred dollars ($2,500) for each one million (1,000,000) foot pounds unperformed, and pro rata for fractional parts down to five million foot pounds less than the guaranteed duty.

"If the duty as shown by the official test be more than five million foot pounds below the guaranteed duty, the Commissioner may, at his option, reject the unit, and in case of such rejection, the contractor shall return all moneys paid to him on account and shall, without compensation, allow the unit to remain in the service and under control of the Commissioner for such a time as may be required to install a new unit, and shall fully reimburse the city for any loss or damage suffered by reason of the contractor having failed to fulfil his guarantee."

In accordance with clause 59, the contractors guaranteed a duty of 141.5 million foot pounds of work per 1,000 pounds of stream used, and this duty was therefore inserted in the contract.

Details of the Trials

The duty trials were run in exact conformity with the specifications, with the single exception of the duration of each, which is specified as twenty-four hours. On discussing the matter with the city's engineers, it was found that the conditions in the station made such a long run very undesirable, and it was agreed that the run should be shortened to ten hours. The contractor agreed to this, and a copy of his letter relating to the matter accompanies this report.

There is no doubt that the results for the ten-hour period would be practically identical with those for twenty-four hours.

The specifications require that the gauge pressure on the boilers supplying the turbines shall be 150 pounds per square inch. A battery of four boilers was used in each case, and on top of each boiler there is a stop valve bolted to the steam drum, and from the top of this stop valve the steam pipe from the boiler leads to a header which is common to all boilers. To this header the supply pipe for each pumping engine is connected by a fairly long, well-lagged pipe.

GENERAL VIEW OF STATION. NOTE ELECTRICALLY-DRIVEN PUMP.

To avoid any possible sources of loss in the boiler stop valve, the gauge used on the trial was connected to the steam pipe within six inches of the stop valve. The gauge pipe was so arranged that the gauge was brought down to the level of the fireman's eye, and correction was made for water column. An observer remained constantly in the boiler room so as to keep this pressure uniform, and readings were noted every 15 minutes.

The quality of the steam was taken by throttling calorimeter attached to the steam pipe about six inches from where it entered the turbine stop valve. For the purpose of determining the quality, the engine pressure was taken and is also recorded; it was taken at the point where the calorimeter was attached. These readings were at 15-minute intervals.

Exhaust Pressure and Temperature

To determine the exhaust steam condition, both a mercury column and a thermometer were used, the mercury column being attached to the turbine casing slightly below the level of the main shaft, while the thermometer was inserted in a cup in the exhaust pipe about half way between the turbine casing and condenser. Much care was taken to push the thermometer well into the cup, so that the bulb was at least 9 inches in from the pipe wall, and the mercury column connections were also carefully tested for leakage. A comparison of the two readings given in the table herewith shows that the temperature is lower than that corresponding to the mercury column, possibly due to the difference in location, and partly to the presence of air in the exhaust. Both results are quite accurate and equally reliable.

Speeds

The speeds were taken with an ordinary revolution counter, or else were actually counted, those on the main pump being at 15-minute intervals; the others were not so frequent. It was not possible to get the speed of the steam turbine directly, and hence it had to be calculated from the pump speed, using the gear ratio given by the contractor of 197 teeth in the gear to 33 teeth in the pinion. The pump and turbine speeds were well below the maximum specified.

Steam Used During Trial

To get the steam used during the trial, the ordinary pipe for delivering the condensate into the feed tank was broken and a connection put in so that the water was delivered into a storage tank, from which it was run into a tank on scales as desired. The leakage from the air pump glands was caught and has been added to that coming directly from the air pump discharge. There was only one trap on the turbine plant, and, as it was plugged, no leakage occurred there.

On the first unit tested the gland leakage was not great, but as it was in the form of steam it could not be measured. In the second unit the leakage was much more marked, due to defective carbon rings, but the steam thus escaping would not have formed any appreciable proportion of the total, and its effect on the duty would be very slight.

The weighing tank was capable of holding a net weight of only about 1,000 pounds, and, in order to keep well within the limits, the weight of steam condensed every three minutes was taken. In order to have no error due to the storage tank, the water in it was brought

to the same level at the end of the test as at the beginning. All weights were taken to half pounds.

The steam used by the air pump is automatically included with that from the turbine, and the feed pump was chain driven from the pump shaft.

Water Pressures

For convenience and greater accuracy the pressure and suction gauges were both piped to the same point, close to the suction inlet pipe, and in the results allowance was made for the difference in levels between them.

Before the test began, considerable discussion took place between the contractors and myself regarding the position of the discharge gauge connection, and also as to whether velocity head was to be allowed for. In this connection it is pointed out that the suction pipe up to the condenser is 42-inch, and the discharge outlet from the pump 24-inch and a tapering enlarger and valves are used to connect the 24-inch pump outlet to the 36-inch delivery pipe provided by the city. The difference in pressure between the two ends of this enlarger was slightly over 7/10 pound per square inch, being greater at the 36-inch end, and amounted to about 7/10 of one per cent. of the total head.

The nature of the specifications prevented allowance being made for difference in velocity head between suction and discharge pipes, and it was also agreed that the discharge connection should be placed on the outlet from the pump where its diameter was 24-inch, and the results are reported on this basis.

The discharge pressures were taken with a sensitive Bourdon gauge, and the suction pressures by mercury manometer; there was always a slight pressure in the suction pipe at its centre line.

Both readings were taken every five minutes, the discharge gauge being carefully calibrated.

Measurement of the Water Pumped

The specifications required that the water pumped should be measured by Venturi meter, and both of the pumps discharged through a 36-inch meter with 21-inch throat. The quantity was calculated from readings of a mercury manometer, using the coefficient supplied by the Builders Iron Foundry, the makers of the meter, who state that a manometer reading of 5.07 inches of mercury corresponds to a discharge of 25.30 millions of Imperial gallons daily.

Readings were taken on the manometer at five-minute intervals, and in order to check the record for the meter, readings were also taken on it, and the results are included for reference.

Observers and Representatives

The observers were all fourth year students in engineering at the University of Toronto, and were well skilled in the work required.

The contractors for the units were the Turbine Equipment Company, Toronto, who were represented by their manager, Mr. Austin, and also by Messrs. Salt and Petersen of the De Laval Turbine Company, Trenton, who designed the machinery and built much of it. The writer represented the city of Toronto, and personally conducted both the trials and desires to express his thanks for the co-operation of the above parties, and also of Mr. James Milne, Mechanical and Electrical Engineer of the Works Department.

Remarks on the Trials

The results obtained on the units are a matter of great satisfaction, partly because they have so far exceeded the guarantees of duty, and partly because the results are exceptionally high for this class of pumping unit, and have probably not ever been exceeded by any similar unit running under similar conditions of steam and of equal water pressures. The city is to be congratulated on having pumps which will give such good results.

Respectfully submitted,
ROBERT W. ANGUS.

ROBERT W. ANGUS.

Toronto, March 20th, 1917.

COAL PRODUCTION IN CANADA

ALTHOUGH, according to a recent report issued by the Department of Mines, Ottawa, it is shown the production of coal during the third quarter of the year was larger than either of the two preceding ones, yet the total for the twelve months promises to be slightly below that of 1916, unless during the fourth quarter the increase is sufficient to make up for the deficiencies of the nine months' operations. The figures for each of the three first quarters of the year are as follows:

	Tons.
First quarter	3,610,991
Second quarter	2,543,429
Third quarter	3,731,123
Total	9,885,543

These figures apply only to the coal that is sold or used by the mine operators and do not include waste and unmarketable slack brought to the surface of the mines.

The total quantity of coal produced by the mines of Canada for the twelve months of 1916 was 14,483,397 tons.

SHIPBUILDING IN B. C.

IT is possible that the shipyards of British Columbia may soon be constructing vessels for the Australian Government. Australia wants vessels, and wants them badly, and negotiations are now being carried on by the shipbuilders of British Columbia with the Government of the Commonwealth with a view to securing orders.

The cost of the material that must be applied to the completion of the ships now under construction in the province will, it is estimated, approximate $1,700,000. In order to finance the shipbuilding undertakings, actual and contemplated, the British Columbia Manufacturers' Association is endeavoring to secure from the Dominion Government what it terms a "shipbuilding loan."

This firm is a good example of continuity of ownership, its duration dating from the establishment of the enterprise some sixty years ago. In the interval, the size of the original plant and the scope and variety of its activities have shown steady development and expansion. As might be expected, effort in these war years has been concentrated to a large extent on munitions production and that of ship deck and other marine equipment.

THE business of William Kennedy & Sons, Ltd., Owen Sound, Ont., was founded by the late William Kennedy in 1857. He was born near Glasgow, Scotland, and came to Canada in 1831, settling first at Prescott, Ont., and later moving to Athens, Ont., where he established himself in business as a millwright. Mr. Kennedy at that time was a lieutenant in the Militia and participated in the Battle of Windmill Point in 1837. He settled in Owen Sound in 1856 and started a foundry and millwright business in 1857. This was the foundation of the present enterprise. In 1860 the plant was established on Sixth Street and was known as William Kennedy & Sons. Two of the founder's eight sons, Thomas and Matthew, at this date joined him in the firm, which then carried on foundry and machine shop work, together with wood planing and the manufacture of sash and doors.

In 1868 the firm sold out their woodworking and specialized in the manufacture of turbine water wheels, heavy shafting gears, pulleys, bearings, etc., required in the driving of mills, power, and pumping plants. In 1873 the manufacture of ship propellers was added to the firm's activities. One of the sons, Thomas Kennedy, died in 1873, and two of his brothers, John (now Sir John Kennedy), and William, Jr., joined the firm in 1879. The founder, William Kennedy, Sr., died in 1885 at the age of 77 years. From that date until 1896, the business was conducted by Matthew as head and Alexander and William Kennedy, Jr. Sir John was only with the firm two years, 1868 to 1870, leaving to become chief engineer of the Great Western Railway, later absorbed by the Grand Trunk. Sir John was some thirty-five years engaged as chief engineer of Montreal Harbor and though blind is still retained as their consulting engineer. He enjoys an international reputation in harbor engineering.

VIEW SHOWING SOUTH END OF DRAWING OFFICE, OWEN SOUND PLANT.

New Plant Erected

In 1880 a part of the premises on Sixth Street was burnt down, business was, however, carried on there until the end of 1884. During the summer of the latter year new shops were constructed on the present site on the harbor front, these consisting of grey iron foundry, machine shop and pattern shop. Operations were commenced in the new plant in January, 1885. In 1887 the Kennedys built for the town of Morrisburg their first water works pumps of any note. These were rapidly followed by similar and larger installations at Welland, Niagara Falls, etc. These pumps with their water wheels and gearing are still in daily service and giving good satisfaction in spite of their age. Alexander Kennedy, who was superintending personally the installation of the Niagara Falls plant, had his arm sheared off between the pump main spur gear and its connecting rod. The accident affected his general health, and after disposing of his stock to the other members of the firm, he died in 1903 very suddenly while at work.

In the meantime, William Kennedy, Jr., was sent to Montreal to open up and conduct an hydraulic engineering office for the company. Some years later he sold out his holdings and severed his connection with the concern in order to carry on the business of consulting engineer on his own account. He

has been for years one of Canada's leading hydraulic engineers and acted as consulting engineer for such plants as the Ontario Power Co., Niagara Falls; the Cataract Power Co., De Cew Falls near St. Catharines; City of Winnipeg; Calgary Power Co.; etc. The name Kennedy has long been well known throughout Canada in connection with the design, manufacture and installation of water power plant machinery.

In 1905 the president's youngest son, T. Dowsley Kennedy, was sent to Switzerland for six months and later to Germany to take a four year University course in hydro-mechanical engineering. He graduated and returned in 1909, and a year later joined the firm.

The present officers and directors are: Matthew Kennedy, president and general manager; D. John Kennedy, 1st vice-president, and manager open hearth

OLD FRAME BUILDING WHERE THE KENNEDYS STARTED BUSINESS IN 1858.

President and General Manager.

steel plant at Collingwood, Ont.; Matthew Kennedy, Jr., 2nd vice-president and manager Bessemer steel plant, Owen Sound, Ont.; D. E. Armstrong, sec.-treas.; T. Dowsley Kennedy, director and manager iron foundries and machine shops.

In January, 1916, the iron foundry and machine shop capacities were greatly increased. A year later the iron foundry was entirely remodelled and again extended to take care of the demand for exceptionally large, solid, ship propellers required in connection with Canada's shipbuilding programme.

The most important development, however, took place in 1916 when the Kennedys took over the defunct Northern Iron & Steel Co. open hearth steel plant and rolling mills at Collingwood, to produce shell steel, about which more appears further on. In 1917 they installed at this plant their first electric furnace, principally for the manufacture of pig iron. With these new acquisitions, the company has two steel plants, the first one having been established at Owen Sound in 1899.

Extent of Business

The Wm. Kennedy & Sons control and operate three distinct plants, the two at Owen Sound working in conjunction on the general business of the concern while the steel plant at Collingwood is working at present exclusively on the production of steel for shells. After the war when the Collingwood plant is turned over to the production of steel for commercial purposes, it will be an extremely useful adjunct to the company's general business. The Collingwood plant comprises two open hearth furnaces, giving a total capacity of sixty to seventy-five tons of steel per day. The electric furnace can also be used to produce steel. At Owen Sound, steel is produced by the Bessemer process, giving altogether considerable latitude in the type of steel produced.

Owen Sound Plant

The head office and plant at Owen Sound will be described first, being the mainstay of the entire business. It is self-contained, the plant being arranged and equipped so that production of practically all the company's lines can be done there. The plant comprises the office building, pattern shop, machine shop, grey iron foundry, steel foundry, cleaning rooms, pattern storages, etc.

SOUTH-WEST CORNER OF PRESENT-DAY OWEN SOUND PLANT.

There is also ample yard space for storing raw materials, molding flasks, etc. The office building is 30 ft. x 50 ft. and contains the general, private, and drawing offices, the latter being upstairs.

The building is of solid brick construction and was erected in 1905. The drawing office is equipped with vertical adjustable drawing boards and the vertical system of filing drawings is used together with suitable card indexes. An overhead bridge proves to be a considerable time saver in the usual traffic between draughting room and pattern shop. The pattern shop is located over a part of the machine shop, and is well suited for handling a variety of work, being equipped to turn out patterns for heavy machinery, more particularly large propellers, heavy gears, and water turbines.

The machine shop is 140 feet long by 40 feet wide, and is suitably equipped with a variety of machinery for handling the extensive line of product manufactured by the firm. In addition to the ordinary tools usually found in a machine shop, there is a large boring mill and two specially fitted drills particularly required for propeller and turbine work; also a Gleason gear planer for machining gears of very large pitch.

EAST END OF MOULDING FLOOR, OWEN SOUND PLANT.

SOLID PROPELLER FOR OCEAN-GOING FREIGHTER WEIGHING 10 TONS AND 17 FT. IN DIAMETER.

The grey iron foundries, 100 ft. long by 45 ft. wide and 60 ft. by 45 ft. wide, are capable of producing a wide variety of work both large and small. As an instance of this, reference may be made to the one piece propeller shown in process of moulding in one of the accompanying illustrations. This is one of a recent order of four 17 ft. diameter wheels weighing 9 tons. To further facilitate the handling of this propeller foundry work, there has recently been installed another up-to-date electric overhead travelling crane of 15 tons capacity and Northern make.

A heavy jolt machine with a table 4 ft. x 5 ft. and operated by compressed air is a big time saver, ramming up moulds for such work as base plates and frames for anchor windlasses and cargo winches, as well as ingot moulds, etc. A 2-ton compressed air steel jib crane having a radius of 27 feet is used exclusively to serve this "jolter." Pneumatic floor hand sand rammers are used on most large work, and air chippers for removing fins and lumps when cleaning castings.

The steel foundry is an important factor in the company's business, and has recently been enlarged to take care of the increased demand for steel castings. The main building of the steel foundry is 182 feet long x 82 ft. wide; part of it is utilized as a cutting-off room. The steel made here is by the Bessemer process in a two-ton capacity converter, the blast being supplied by a Roots blower driven direct by a steam engine. The mixture for the converter is melted in a Sheldon cupola, the blast being supplied by a Sheldon motor-driven fan. The materials are hoisted to the charging floor by means of a 3 ton Sprague electric hoist. The molten metal is transferred from the cupola to the converter in a truck ladle.

The quantity and quality of materials used in the converter are carefully checked by analysis and are controlled by their own laboratory tests, the company maintaining a metallurgist for this purpose. One advantage in having the Bessemer process is that the cupola can be used for either steel or iron foundry work as required. This cupola is, of course, additional to their regular iron foundry melting equipment. Close laboratory control is also effected in the use of materials and alloys so that different grades of steel and iron castings can be produced as required. There are two 5-ton Northern overhead electric travelling cranes in the steel foundry which can operate in the iron foundry when necessary in case of breakdown or

STEEL FOUNDRY CLEANING ROOM, OWEN SOUND PLANT.

for helping out on extra heavy lifts.

Adjoining the steel foundry is the sand mixing room in connection with which is a sand handling plant of considerable merit. The new silica sand and clay are elevated by a vertical bucket conveyor into large overhead storage tanks. From the tanks the materials drop through chutes and are accurately measured before being mixed in the 6 foot motor-driven rotary mixer and grinder. From there the sand is carried in dump buckets to the various sections of the moulding floor by means of a monorail system. All moulds are carried by the travelling cranes from the moulding floor to large drying ovens where they are dried. The moulds then pass out at the opposite end of the ovens and are distributed on the casting floor by the same cranes; the ovens being located between the moulding and casting floors give a proper routing of work through the shop. The moulders, therefore, do nothing else than actual moulding work.

The cleaning room 50 ft. x 100 ft., with storage in second storey, is equipped with motor-driven tumblers, a sand blast, pneumatic chipping tools, etc. Patterns are stored in large fire-proof rooms conveniently adjoining moulding floors. The storage is divided into sections and indexed for convenient reference. Adjoining the pattern storage is the electrician's department where are also the switchboard appliances for distributing power from the Hydro System. There is located in the pattern storage a heating and ventilating system for the foundry. This plant was supplied by Sheldons Ltd. of Galt. A similar plant is installed in the iron foundry.

MOLDING LARGE SOLID PROPELLER—TOP SECTION OF MOLDING BOX REMOVED TO SHOW PATTERN. OWEN SOUND PLANT.

A steam power plant is situated alongside the steel foundry, in which are installed a return tubular boiler for heating purposes, the steam engine driving the converter blower, a motor-driven Ingersoll-Rand 300 cubic feet twin cylinder air compressor for suppling compressed air for various purposes throughout the plant. In the cutting off room of the steel foundry, there is installed among other equipment an oxy-acetylene welding and cutting outfit. The flask storage for the steel foundry is served by a network system of overhead monorails, while the flask storage for the iron foundry is handled by a 75 ft. power derrick with a 60 ft. boom.

Products Classified

The firm have continuously developed the scope of their business, particularly during recent years, until now it includes:—

Auxiliary ship machinery including propellers.

Water power plant machinery.

Heavy transmission machinery, cut gears, etc.

Steel and iron castings.

Kennedy cutting-off machines for trimming shell forgings and cutting heads off steel ingots.

Shell steel and pig iron.

Auxiliary Ship Machinery

This section may be sub-divided to include the following:—Anchor windlasses, chain stoppers, steering engines, cargo winches, ash hoist, propellers, etc.

Propellers are made in steel, iron or bronze, sectional or solid. Following up their policy of expansion in the auxiliary ship machinery end of the business resulting from the submarine menace, the Kennedys have secured the sole Canadian manufacturing rights for the equipment made by the well known Hyde Windless Co., Bath, Maine. This concern, like the Kennedys, has had the benefit of over fifty years' experience in this class of work and had done over half of U.S.A. Government naval and

INTERIOR VIEW OF STEEL FOUNDRY SHOWING BESSEMER CONVERTER AT LEFT. OWEN SOUND PLANT.

merchant marine work up to the time of the war.

The Kennedy anchor windlasses as now constructed are, therefore, the result of many years' experience of two old concerns and embrace details of construction which have made these units well suited to the work they have to perform. Some of the principal features claimed for the Hyde-Kennedy windlasses are accessibility to all parts for repair; their widest part is aft, thus following approximately the shape of the boat so as to allow as uniformly a clear deck space around the machine as possible. All gearing and shafting are also aft, so as to be well clear of the action of anchor chains. The warping drums run at a high speed for quick handling of hawsers or other ropes. The "Wild Cats" or chain sprockets are also easily thrown in or out of gear when full strain is on the anchor chains and friction brakes.

Probably the best known steering engines manufactured are those of the quadrant, drums, steam-tiller and battleship screw types. The cargo winch is made with either vertical or horizontal engines, the latter being more popular on the Pacific Coast although seldom used on the Atlantic.

Propellers

Kennedy propeller wheels are the result of long, untiring and successful effort. Methods of manufacture have been developed by which castings are true to pattern, uniform in weight, and smooth in finish. The view of a propeller being moulded shows specially developed equipment for doing this class of work. The illustration shows one blade with the top half of moulding flask removed, the other blades being covered. The rigid cast iron moulding flasks prevent any straining or warping of the mould.

At Owen Sound there have recently been completed a number of what are probably the largest sized solid propellers yet made in Canada. These wheels were made for Canadian Vickers, Ltd., of Montreal for ocean-going cargo steamers and are 17 ft. in diameter. An interesting steel propeller hub recently made for the S.S. Hamonic of the Canada Steamship Lines is also illustrated.

Water Power Plant Machinery

In the year 1868 when the Kennedys first began to make water wheels, the hydro-electric method of generating power was in its infancy in Canada and the plants in operation consisted as a rule of comparatively small units. In later years, the water powers in the country, which are a tremendous asset, have been turned to good account and are now in many districts the principal source of power. This is true of a large number of private plants as well as Government and municipal installations. At the Owen Sound plant there have been produced the units for numerous installations throughout Canada. This branch of the business has made its greatest development in the last decade, in which time the design of the turbine has been considerably improved.

The bulk of the Kennedy made turbines are of the Francis reaction-type which was developed to a high degree of perfection in Europe. These turbines have horizontal or vertical shafts and are suitable for medium and low pressures. As a rule the heads under which they work are sufficient to enable the modern turbine to give a speed high enough to allow direct coupling to a generator. The specific speed of Francis wheels, by which is meant the r.p.m. which a single runner turbine would have if operating under meter head and developing metric horse-power, may be varied by suitable design between 150 and 400 practically without reducing the efficiency. The wide speed variations possible with the Francis turbine is the principal reason for its popularity for reaction work. The best European makers have developed several standard series of Francis runners to secure a wide range of speed corresponding to specific speeds of 150, 200, 275, 350 and 400, the first two being generally used for medium pressure turbines; the other three, especially the last two, for low pressure turbines. Medium pressure turbines are in successful operation for heads up to 350 feet.

Following are a few instances of important water turbine installations carried out by the firm. A large water turbine was built for the Wahnapitae Power Co., of Sudbury, Ont. This unit is a twin horizontal central discharge turbine with end intake, and is rated at 2,500 h.p. Several units of water turbines each having a capacity of 4,500 h.p. have been built and installed in the Ottawa and Hull Power Mfg. Co. plant at Chaudiere Falls. A feature of these units is the internal heating system in the gates of the turbines to prevent clogging by frazil ice. Other plants since installed in the same district have been similarly equipped as a result of satisfactory performance. Five turbines have been installed at Campbellford, Ont., for the Seymour Power Co., these units being twin vertical type with central discharge. The oil step is of special construction supporting not only the entire weight of the turbine rotating parts but also the generator rotor, which is direct-connected to the turbine.

STEEL PROPELLER HUB FOR UPPER LAKES PASSENGER AND FREIGHT STEAMER "HAMONIC."

CHARGING FLOOR 17-TON ACID OPEN HEARTH FURNACE.

Stop Log Hoists

Another specialty to be included in the water power equipment class is the stop log winch or hoist. The firm are pioneers in the manufacture of winches or hoisting machines for lowering, raising, and piling of stop logs used in sluice dams. These dams have given great satisfaction and are favorably looked upon by engineers owing to the large quantity of water which can be put through them during times of high water and they have also the advantage that during times of low water the head can be kept up to the maximum, thus greatly increasing the efficiency of a water power installation.

The stop-log hoists or winches are of very rigid and heavy construction, so as to ensure safe and quick handling of the logs when operating against full flow and pressure of water. A 27-ton capacity installation at the Calgary Power Co. plant at Kamanaskis in the Rockies, is operated by electricity even to the piling of the stop logs on the deck of the dam where they remain during high water. Handpower stop log hoists are also manufacture. Standard machines are built in three sizes—35, 27, and 17 ton rated capacities.

Transmission Gears

Heavy gears are a prominent specialty of the firm. They regularly make large machine cut gears both bevel and spur up to 100 inch pitch diameter, and 20 inch face. A number of heavy gears were recently supplied the Goodyear Tire & Rubber Company, New Toronto.

TAPPING OUT 17-TON HEAT OF STEEL.

Steel Castings

This branch of the business covers the whole wide field so fully that it is unnecessary to particularize here.

Reversible Dipper Tooth

The reversible point dipper tooth for dredges and steam shovels was designed and patented by Sir John Kennedy and is made at Owen Sound to meet the requirements of hard service in dredging. The interesting feature of this tooth is that the wearing point is reversible. In other words when one side wears down the points may be reversed and so on until it is entirely worn out. The reversing operation takes only a few minutes and no special tools are required in its performance. When the point wears out, it is just as quickly replaced by a new one. They have proved satisfactory even in digging rock.

Collingwood Steel Plant

Early in the fall of 1915, after the completion of the 4.5 inch shell steel contract at Owen Sound it was found that no further contract could be received. This was due to the limited tonnage of steel that could be produced by the Tropenas converter, and the exceptionally high cost of the output on account of the greater quantity of low phosphorus pig iron used in this process than in the open hearth. It was therefore felt that some other means should be adopted so that the experience gained by the firm in the manufacture of high grade steel would not be lost to the country in time of war. With this in mind it was decided to look around for some suitable place in which to locate to produce munition steel. After examining several plants it was agreed to repair and commence operating the plant of the old Cramp Steel Co., the latter owned by the Northern Iron & Steel Co., Collingwood, Ont. This plant had been idle for fifteen years and the machinery and buildings were in a very bad state of repair. It was found

STRIPPING 9.2 IN. H.E. SHELL BLANKS.

that the two fifteen-ton basic open-hearth furnaces would have to be torn down and rebuilt as acid furnaces. Besides repairing and entirely remodelling the property, it was necessary to instal new machinery and two railroad sidings to take care of the ingots produced. This work was commenced in January, 1916, and it was not until July of the same year that the first heat was taken off.

Since that date there have been manufactured three sizes of steel ingots —the 8-in. shell blank weighing 390 lbs. when cast, and 283 lbs. when shipped; the 9-2 in. shell blank weighing 500 lbs. cast and 390 lbs. shipped and the 12-in. x 10¼-in. square steel ingot for rolling, which weighs 1,500 lbs. cast and 1,350 lbs. shipped. The plant is now casting 6-in shell blanks at the rate of 1,000 per day. The rolling mill is capable of rolling rods and bars up to 3½ finished diameter, but has not been operated as yet by the Kennedys, although they would entertain a reasonable proposition from any reliable experienced rolling mill men to do so. The dimensions of these different sizes are shown on sketches marked A, B, C, and D, respectively.

2,500 H.P. WATER TURBINE OF TWIN HORIZONTAL CENTRAL DISCHARGE TYPE WITH END INTAKE, BUILT AT OWEN SOUND PLANT.

STEEL BILLETS FOR VARIOUS SIZE AND TYPE SHELL PRODUCED AT COLLINGWOOD PLANT.

The operations cover a twenty-four hour day. The charging floor and casting floor labor involves three shifts of 8 hours each. The cutting off and electric furnace departments are two shifts of twelve hours each. The four hundred employees turn out two thousand shipping tons monthly.

During the spring of 1917, the low phosphorus pig iron situation became very acute. The production was less than the demand, and the prices advanced very rapidly. Arrangements were made for a supply of electric power to operate an electric pig iron furnace. This furnace reduces turnings, etc., into low phosphorus pig iron with the addition of carbon and ferro silicon. It produces from 12 to 15 tons daily, according to the amount of power received. About 1,000 h.p. is required.

COAL AND STEEL IN NOVA SCOTIA DURING 1917

By F. W. Gray, M.I. Min. E.*

IN an article reviewing the coal industry for 1916 which appeared in CANADIAN MACHINERY a year ago, the writer forecast that the coal output for 1917 would decline to a figure between 5½ and 5¾ million tons. From present indications it appears that the production of 1918 will show a still further decline to between 5¼ and 5½ million tons. The capacity of the Nova Scotia coal mines for output is 7½ million tons per year, so that the present rate of production is not less than two million tons per year below the possible tonnage were sufficient labor available.

The coal production of Nova Scotia in long tons during the war period compares with the year preceding the war as follows:

1913	7,263,485
1914	6,650,038
1915	6,708,695
1916	6,190,000
1917 (about)	5,735,000

The cumulative shortage for the war period to the end of 1917, computed on the 1913 basis, is about six million tons. At a value of $4.00 per ton, this shortage represents a sum of say $25,000,000 that has been expended in the United States for a raw material which could and should have been produced in Canada. A sum of this magnitude is not a negligible factor in the matters of trade balance and the rate of exchange, apart altogether from the throttling of industry that is caused by coal shortage.

The most notable decline in production is in the case of the Dominion Coal Co., its output having dropped from 4,091,790 tons in 1916 to 3,575,000 tons in 1917, if the Glace Bay collieries only are included. The output of the Springhill Collieries remained about the same as in

*Dominion Steel Corporation, Sydney, N.S.

1916. A noteworthy feature of the year is the aggregate tonnage of the smaller operators, situated principally on the fringes of the Pictou field and in the neighborhood of Maccan and Athol. This amounts to no less than 100,000 tons. Unfortunately, however, this increase in smaller operations does not begin to counterbalance the reduction in the outputs of the larger companies, nor is it a factor of permanence. The exploitation of abandoned areas and crop workings is an ephemeral condition caused by the prevailing coal shortage and the high price obtainable for coal in local markets. These small operators will in large measure disappear when the coal markets again become normal.

No Excess Supply Imminent

It must be admitted, however, that there is no immediate prospect of any excess of supply over demand in the coal market. So far as Nova Scotia is concerned, the shortage of labor has forced a cessation of all new development at the coal mines, and whenever a sufficient labor supply becomes available it will be found that the existing coal mines will have been so depleted that several years must elapse before the lost ground can be regained.

The decline in the coal outputs has indeed reached a stage where it threatens to restrict the production of steel. The product of the coal seams is not uniformly suitable for metallurgical purposes, and in several instances the supply of metallurgical coal is not at all reassuring for future expansion of steel manufacture.

Numerous Wage Increases

The year 1916 was marked by a succession of wage increases at the collieries, these being granted in quicker rotation and more substantial in amount than in any comparable period in the history of coal mining in the province, but 1917 in this respect has equalled the record of 1916. In May of this year the Provincial Workmen's Association made a demand upon the coal operators of the Sydney district for an increase in wages of 25 per cent. The matter was complicated by the attitude of the rival Miners Union, the U. M. W. of Nova Scotia. Applications were made for a conciliation board by several parties, but eventually a Royal Commission was appointed which devoted its chief attention to a reconciliation of the rival unions.

On the recommendation of the commission an increase in wages was granted to workmen at the collieries of 12½ per cent. plus an increase of 10 cents per day to workmen earning less than $2.50 per day. A provisional union of the two labor organizations was brought about. This was consummated later in the year, resulting in the formation of the Amalgamated Mine Workers of Nova Scotia, which body took over the existing wage agreement between the P. W. A. and the operators, more particularly the arrangement between the P. W. A., and the Dominion Coal Co.

Demand for Further Wage Increase

The A. M. W. of Nova Scotia has served the operators in the Sydney district with notice of the termination of the existing wage agreement as at the end of the year, and has demanded a wage increase ranging from a minimum of 30 per cent. up to 75 per cent. advance on existing rates. It is absolutely impossible, from the standpoint of the operators, to grant an increase of the magnitude asked, as it would necessitate an increase in the selling price of coal of from $1.50 to $2.00 per ton, and even at this increase in selling price some of the less remunerative collieries would be compelled to cease operations.

In view of the fact that the increases which have been granted in wages have already exceeded the calculated increase in the cost of living, it is felt that there is no real justification for the heavy increase asked by the A. M. W. of Nova Scotia. It is not anticipated that any stoppage of work will result, and the disagreement between the A. M. W., and the operators will probably end in the appointment of a board of conciliation.

The Explosion at New Waterford

The most important single occurrence of the year was the explosion at the No. 12 Colliery of the Dominion Coal Co. at New Waterford which resulted in the death of 65 men. Arising out of this, three prominent mine officials, namely, the superintendent of the Waterford district, and the manager of No. 12 Colliery, both officials of the Dominion Coal Co., and the deputy inspector of mines for the Waterford district, an official of the Provincial Department of Mines, reporting to the Inspector of Mines, have been indicted by a Grand Jury on a charge of manslaughter. The indictment has caused much comment among the mining officials of the province as there is no precedent in the latter for the criminal prosecution of mining officials, except through the intervention and direction of the Inspector of Mines. The indictment of the Deputy Inspector of Mines is regarded as a particularly unprecedented incident.

Dominion Steel Corporation

Large plans for extension of the steel industry in the Sydney district are mooted, but so far the shortage of labor has been a serious deterrent to any undertakings of consequence in this direction, with the exception of the new coke ovens of the Dominion Iron & Steel Co., which are making fair progress towards completion. The brick stacks are erected, the foundation work mostly finished, and the site of the oven structures has been thoroughly built-in for protection from the weather so that the erection of the ovens can proceed uninterruptedly throughout the winter. It is hoped that the first block of ovens will be making coke in the early summer of 1918.

One of the blast furnaces of the Dominion Iron & Steel Co. has been completely re-built on a much larger scale, and will be ready for operation next spring.

As part of the plan which includes the re-building of No. 1 blast furnace and the erection of the new coke-ovens, the Dominion Iron & Steel Co. are also erecting a new coal-washer, and the combination of modern coke-ovens with the latest type of coal-washer is expected, with the new blast furnace, to bring about a great improvement in the yield and quality of steel, accompanied by considerable economies in the practice.

Nova Scotia Steel & Coal C.

There are indications that the policy of the Nova Scotia Steel & Coal Co. will in the future concentrate more upon the manufacture of steel and steel products than upon the mining of coal for sale in the open market. During 1917 the Nova Scotia Steel & Coal Co. did not send any coal to the Montreal market, while the Dominion Coal Co. shipped only 50,000 tons, which compares with 2,000,000 tons in seasons prior to the war period.

The fabrication of steel freighters has proceeded steadily throughout the year at New Glasgow, and it may be confidently expected that further development is to take place in shipbuilding in the province. Indeed the hesitancy and lack of enterprise shown by the province in this matter of steel shipbuilding is in strange contradiction to the usual attitude of Nova Scotians whenever opportunities have offered in the past. There was surely never a time in history when the demand for steel ships was so insistent, and so likely to remain insistent as is the case to-day.

The Canadian Government made a capital mistake when it cancelled the privilege previously granted to Norwegian and other foreign ships to trade in Canadian coastal waters and did not simultaneously offer a system of bounties to encourage shipbuilding in Nova Scotia. The cancellation of the coasting privileges without the necessary corollary of a policy to stimulate shipbuilding in the province seemed incomprehensible at the time, but to-day it stands revealed as a first class omission.

To sum up the prospect for the steel industry in the province seems quite encouraging, but the thing that causes disquietude is the ever declining coal output, and the probability that production of coal is bound to continue declining.

Dinner was a little late. A guest asked the hostess to play something. Seating herself at the piano, the good woman executed a Chopin nocturne with precision. She finished, and there was still an interval of waiting to be bridged. In the silence she turned to an old gentleman on her right and said: "Would you like a sonata before dinner?"

He gave a start of surprise and pleasure. "Why, yes, thanks!" he said. "I had a couple on my way here, but I think I could drink another."

Staff Article

The inherent possibilities of shipbuilding and marine engineering are realized as never before in our experience, combining as they do staple industries in themselves of large proportions and the medium through which a myriad other enterprises, large and small, agricultural, mineral and manufacturing, may find opportunity to more fully expand and develop.

THE revival of shipbuilding on her lake and ocean shores has been an outstanding feature of Canada's industrial achievement during the past year. Wood as well as steel has entered largely into individual vessel construction, the former constituting the hull material not only for auxiliary powered schooners but for ocean-going steamships propelled by standard type marine engines or steam turbines as well. Needless to say, the revival is entirely due to the necessity of our aiding to offset the losses arising from German submarine activity and the otherwise abnormal demand for tonnage to maintain the world's commerce and to keep the Allied fronts supplied with both men, munitions, and merchandise.

Many new shipyards have been established all of which together with those of many years standing being taxed to capacity with orders at least twelve months ahead. Complete returns are not yet available of the year's output, nevertheless, although it will not eclipse the banner year of 1874, the tonnage for which mounted up to some 190,000 tons for 487 vessels, a reasonably close approach to that tonnage will be the ultimate record. Number of vessels will also be fewer.

Marine Engineering

Marine engine building, ship deck and engine room auxiliary machinery manufacture are lines of endeavor to which Canadian metal working plants have applied themselves as a result of the shipbuilding activity, and in each of these spheres perhaps even greater success has been achieved than in the purely ship construction feature, due to the fact that many plants specializing in more or less similar equipment for stationary or land requirements found little difficulty in meeting the specification demand for boardship installations.

Wood Schooner Construction

In the early part of the year quite a number of auxiliary powered ocean-going schooners of wood construction were built and completed in British Columbia, and several of them have already made voyages to Australia and back. The advent of the Imperial Munitions Board, Ottawa, with contracts for large steam-engine propelled steel and wood ocean-going freighters had the effect of halting the construction of auxiliary powered wood schooners, hence the concentration of effort on the former in recent months.

Wood schooner construction continues to be actively prosecuted, however, in Nova Scotia, some twenty-five or thirty little shipyards being engaged in the building of that type of craft in tonnages ranging from 150 to 1,000 tons gross.

The placing in the early spring by the Dominion Government of contracts for a large number of trawlers and drifters in wood and steel, and steam engine propelled, intensified the otherwise briskness that had begun to make itself felt in shipbuilding and marine engineering circles, especially as deliveries of these craft were called for in all cases before the season of navigation closed.

Numerous contracts have been received during the year by our steel shipbuilding yards from interests unconnected with either the Imperial or Dominion Governments, data concerning which will be found in the individual plant references that follow .

COMPARISON BETWEEN CANADA'S SHIPPING—SEA-GOING, COASTAL, LAKE AND RIVER VESSELS AT CONFEDERATION AND NOW.

It is of course well known that the American Government through its Shipping Board and Emergency Fleet Corporation has a gigantic shipbuilding programme on hand, the vessel constituent of which embraces both wood and steel construction as in the case of the contracts placed by our Imperial Munitions Board. Propelling and auxiliary machinery, the latter including that required for ship deck and engine room, has been ordered in a majority of instances separate as to location of vessel hull construction as well as separate as to firm engaged on the latter.

The idea behind the scheme is of course to enable plants with contracts for hulls and their accessories to concentrate wholly on these, and the plants with machinery contracts to concentrate wholly on that particular feature.

Participation in U. S. Contracts

A number of enterprising Canadian metal-working plants took advantage of what appeared to them an opportunity to participate in the distribution of machinery orders for vessels on the American Government programme, and we are pleased to say that several hundred thousand dollars worth of such business has been secured as a result. At this writing, we are in a position to state that good progress is being made in the matter of this particular equipment output, and little doubt is entertained but that further substantial contracts are likely to be booked from the same source.

A gratifying feature of the shipbuilding and marine engineering industry in Canada during the year has been the absence of labor troubles, of such a nature at least as to tie up production for any great length of time. Departmental strikes have been of frequent occurrence nevertheless, the demand more often than not being for higher wages.

Labor scarcity—skilled and unskilled—has affected adversely the output of new construction at many centres, and now that conscription is operative, there is little chance of relief being afforded until the war is over.

Canadian shipyards have also been

much hampered in their operations as a direct result of the United States war activities. The plate and shape requirements of the latter for its shipbuilding programme added to its munitions steel needs called for an embargo being placed on commodities of that nature, and while provision is made whereby export under license may be effected, no end of inconvenience and delay has been experienced in procuring material.

At the moment no relief is in sight notwithstanding the fact that our Government and our manufacturers, individually and collectively, have sought a "way out."

Ship construction costs come high these war times both from a wage and material point of view, yet having regard to the need of "bottoms," it may be said without fear of contradiction that cost is secondary to either prompt receipt in quantity of the steel, or the labor to make use of that steel to the best advantage.

I. M. B. Steel Vessel Contracts

As already stated, the Imperial Munitions Board have placed contracts for wood as well as steel ocean freighters, both classes of vessel being steam engine propelled. The total number of steel ships ordered by the Board up to December 3rd is given as forty-four, of which four had been delivered. Their individual capacity ranges from 1,800 to 8,800 tons d.w., making a grand total carrying capacity of 213,600 d.w. tons.

The steel ships are being built at New Glasgow, N.S.; Montreal, Toronto, Welland, Midland, Collingwood, and Port Arthur, Ont.; Vancouver and North Vancouver, B.C. The majority of the vessels are of the 3,400, 3,500 d.w. capacity class, each shipyard being responsible to a great extent for the creation of the necessary specifications and drawing.

I. M. B. Wood Vessel Contracts

The total number of wood steamships ordered by the Imperial Munitions Board up to December 3rd is given as forty-six. Twenty-seven of these are being built in British Columbia and nineteen in Eastern Canada. The individual carrying capacity of the wood ships is 2,500 tons d.w., making a total carrying capacity of those on order of 115,000 d.w. tons.

BOW VIEW OF S.S. "PORSANGER," SHOWING ALSO LAUNCHING PLATFORM AT CANADIAN VICKERS SHIPYARD, MONTREAL.

The wood ships are being built at Liverpool, N.S.; St. John, N.B.; Isle of Orleans, Cote St. Paul, Quebec and Three Rivers, Que.; Toronto and Fort William, Ont.; Coquitlam, New Westminster, Vancouver, North Vancouver, and Victoria, B.C.

From the foregoing it will be noted that the Imperial Munitions Board have placed orders during the year for new construction—wood and steel, covering ninety vessels of an aggregate tonnage, carrying capacity, of 328,600 d.w. tons.

Norwegian Vessel Contracts

In addition to the vessels placed with Canadian shipyards to Imperial Munitions Board orders, twenty-two steel steamships of 3,500 tons d.w. capacity have been ordered by outside companies on Norwegian account, or a total in this connection of 77,000 d.w. tons. Adding this to the wood and steel tonnage placed by the I. M. B., there is shown under contract in the Dominion a total of 405,600 d.w. tons, the value of which somewhat exceeds $80,000,000.

Canadian Allis-Chalmers, Bridgeburg, Ont.

The Canadian Allis-Chalmers, Toronto, Montreal and Bridgeburg, Ont., have contracted with the Imperial Munitions Board, Ottawa, for the construction of four steel steamships of 3,500 tons each, and good progress has already been made on the plant layout and with the equipment installation, notwithstanding the fact that a definite decision to include shipbuilding and marine engineering among the other activities of the Company was only come to within the last two months or so.

Some ten years ago a lake freighter was built at the Bridgeburg plant, but since then the fabrication of structural steel has constituted the principal output. The leading dimensions of each of the four vessels are as follows:

TANK TOP OF STEEL VESSEL UNDER CONSTRUCTION IN SHIPYARD OF J. COUGHLAN & SONS, VANCOUVER, B.C.

STEEL VESSEL IN FRAMES AND PARTLY PLATED IN SHIPYARD OF J. COUGHLAN & SONS, VANCOUVER, B.C.

STEEL SHIPBUILDING YARD OF J. COUGHLAN & SONS, VANCOUVER, B.C.

SCENE ON LAUNCHING PLATFORM IMMEDIATELY BEFORE THE S.S. "PORSANGER" LEFT THE WAYS AT CANADIAN VICKERS SHIPYARD, MONTREAL.

S.S. "PORSANGER" TAKING THE WATER FROM CANADIAN VICKERS SHIPYARD, MONTREAL.

Length over all, 261 ft.; beam molded, 43½ ft.; depth molded, 23 ft. They will be of the usual bulk cargo type, of Class 100 A. I. Lloyd's Register, and will embody in their design, structural detail, and equipment, such features and appliances as will render them immune to the fullest possible extent from enemy submarine attacks.

The steel is being supplied by the British Government through the Cunard Steamship Co., and we understand that a considerable tonnage has already been delivered to the plant.

The propelling machinery is to be built at the Company's Davenport Works, Toronto, and will consist of single screw triple expansion engines of the surface condensing type, the cylinder diameters being 20 in., 33 in., and 54 in., by 40 in. stroke. There will be two boilers in each ship, of 14 ft. in diameter by 12 ft. long. Howden's system of forced draught will be installed and the working steam pressure will be 180 pounds per sq. inch.

Coal bunkers of 500 tons capacity will be located in the wings of the boiler space and under the bridge deck. The cargo holds will be three in number, that abaft the engine room having two hatches and those forward having one hatch only. Each cargo hatch will be served by two independent cargo derrick booms of 5 tons capacity, and each boom will have its independent cargo winch.

A steam steering engine will be located in a special house abaft of the engine casing on the upper deck. The life-saving equipment will consist of two 25 ft. lifeboats and one 18 ft. working boat. The water ballast tanks of three feet depth amidships will extend the entire length from the collision bulkhead forward to that of the peak tank aft. Living quarters will be steam heated and electric lighting will be installed throughout.

SECTION OF MACHINE SHOP, YARROWS, LTD., ESQUIMALT, B.C.

Yarrows, Ltd., Esquimalt, B.C.

During the present year, Yarrows, Ltd., Esquimalt, B.C., have carried out a considerable amount of naval repair work for the Imperial, Canadian, and Japanese Governments, and when this statement was prepared activities in the like direction had by no means ceased. Apart from the foregoing, the firm during the past twelve months has undertaken much work of a general marine character, among which may be mentioned that of a Grand Trunk Pacific Co. steamship that had been ashore. This vessel was repaired at Esquimalt, which involved the renewel of practically the ship's bottom for a length of 180 ft.

Among other repair work of an interesting and arduous nature to which the energies of the plant have been directed in recent months may be cited that of the Niels Nielson, an 8,800 ton cargo vessel, which had sustained heavy dom-

FRONT AND BACK VIEWS OF COMPOUND SURFACE CONDENSING MARINE ENGINE WITH CYLINDERS 18 IN. AND 38 IN. IN DIAMETER BY 24 IN. STROKE, BUILT BY GOLDIE & McCULLOCH, GALT, ONT.

age due to stranding; the fitting of an 18 ft. diameter manganese bronze propeller to a new fully laden vessel of 8,800 tons cargo capacity which had been brought back from sea in a disabled condition; the removal of some 37 plates, the relining and straightening, and removal of the stern frame of the steamship Gray which, in addition to being badly damaged generally, had her back broken and buckled.

Aside from the foregoing, a large number of vessels of various sizes and types have been drydocked for minor repairs and overhaul.

In the matter of new work during 1917, the firm have completed and shipped to India two sternwheelers of 132 ft. in length and 32 ft. beam, two more exactly similar and one of larger dimensions being at present under construction.

Yarrows Ltd. have made a specialty of the manufacture of cast iron and manganese bronze propeller blades, some of the latter weighing as much as 12 tons. In this connection it may be mentioned that the 18 ft. diameter manganese bronze propeller already referred to was cast, fitted, and the ship made ready for sea within a week without docking or disturbing her cargo, the work being carried out by building a wood cofferdam around the stern of the vessel.

A specialty has also been made of the conversion of steamships from coal to oil burning, one of the most recent jobs being that of the cable ship Restorer, which was fitted out to carry 10,000 barrels of fuel oil. Several of the C.P.R. steamers, the coast fleet of the G.T.P. and various local dredges have all been converted from coal to oil burning.

During the year the firm has made many large marine engine and other castings, consisting of bedplates, cylinders for triple expansion engines of 24 in., 38 in., and 62 in. diameter by 42 in. stroke; also some large nitric acid retorts running up to a weight of 8 tons each.

An oxy-acetylene cutting and welding outfit, a galvanizing plant, and the provision of the necessary equipment to handle expeditiously and efficiently special coppersmithing and pipe work, round out a shipyard installation admirably adapted to meet the needs of the local shipping and those of much farther afield.

The yard is situated at Esquimalt Harbor adjoining the site of the proposed new Government drydock, and covers an area of about 8 acres. The wharf is over 500 feet long and can accommodate on both sides vessels sent in for overhaul and repairs. The marine railway can take care of vessels up to 300 feet in length and of 2,500 tons deadweight. Vessels of larger size up to 480 feet are handled in the drydock. A 60 ton shearlegs and a 10 ton floating

MARINE RAILWAY AND REPAIR SLIPS, YARROWS, LTD., ESQUIMALT, B.C.

derrick are conveniently located for dealing with heavy lifts. There is also a floating compressed air plant for use on vessels lying off the yard. An average of 250 men are employed the year round.

Yarrows, Ltd., of Esquimalt, B.C., has direct association with Yarrows & Co., Ltd., of Glasgow, Scotland.

Goldie & McCulloch Co., Galt, Ont.

The Goldie & McCulloch Co., Galt, Ont., up till early in the present year had not undertaken the building of marine engines; the statement which follows is, therefore, the more interesting, as showing what can be done by an engineering firm well equipped and organized in other than its regular lines of manufacture.

The company was asked early in the year if they could undertake the building of a number of compound marine engines, with pumps, surface condensers, etc., complete from stop valves to propellers, of a size to develop 200 indicated horse-power with steam at 140 lbs. per sq. in. working pressure, and piston speed of 500 ft. per minute. The accompanying line cut and half tones serve to illustrate the completed engine features. The cylinder diameters are 18 in. and 38 in. in diameter by 24 in. stroke. A total of one hundred of these engines was required of which the Goldie & McCulloch Co. were awarded forty, the remainder being placed in lots of thirty downward among plants in Canada and the United States.

BOW VIEW OF STEEL FREIGHTER "WAR DOG" WHILE ON THE WAYS.

As all the firm's machine tools were not available at the time, a large number being employed on munitions work, an arrangement was made with the Canada Machinery Corporation, Galt, Ont., to undertake some of the machine work, the various parts being divided into unit groups capable of being finished and assembled complete in themselves.

As the drawings, all of which were supplied to the different contractors, arrived, they were at once sent into the shops and at the same time jigs were put in hand for machining and drilling the various parts. These jigs were ready ahead of the castings and forgings for which they were intended, so there was no delay on that score.

The first drawing was received about April 10. Pattern work was at once started, a number of special moulding boxes, some in duplicate for certain parts, being got ready at same time. Casting proceeded at a rapid rate and it was a common occurrence for a cylinder, bed-plate, condenser shell, propeller, two stern tubes and a quantity of smaller castings to be made per day for several consecutive days. Several sets of the larger castings were at the same time made for another concern. The firm were considerably handicapped by slowness in delivery of heavy forgings, condenser tubes, etc., which they had to purchase, and also by the fact that sufficient skilled labor to run a night shift was not procurable. Good progress was made notwithstanding.

The stern tubes, tail shafts, and propellers being required first to let the shipbuilders finish the hulls, the first effort was concentrated on these and shipment averaged five complete sets per week for several weeks. The first engine and condenser were shipped on

OCEAN FREIGHTER "WAR DOG," 300 FT. B. P., 45 FT. BEAM, AND 27 FT. MOLDED DEPTH, BEING LAUNCHED FROM WALLACE SHIPYARDS, NORTH VANCOUVER, B.C.

August 24, and the last on November 27 —about 13 weeks. It will be seen from the above that shipments over this period averaged over three engines per week.

At the start shipments were naturally slower but as the work came forward and the men got used to it they speeded up with the result that, for six weeks, shipments averaged four per week, and for two weeks five engines were completed and tested each six days. We understand, that when about thirty-five engines had been shipped, the total received from the eight or nine other builders combined, had been equalled.

While these engines were being constructed, the Goldie & McCulloch Co. were also busy on other work in their engine department. Thirty-three shiplighting engines of their well known forced lubrication type were completed, and considerable work was done on another order of fifty of same type. They are building at present some one hundred and twenty of these engines for lighting sets, connecting to fans, and pumps for shipboard work, for various shipbuilders, government and naval requirement, including the United States Emergency Shipping Board.

The vertical enclosed forced lubrication engine is used to the exclusion of almost all others by British shipbuilders for small auxiliary engines and the Goldie & McCulloch Co. have developed it in accordance with the best British practice. One of their compound admiralty type installations is shown connected to armoured generators made by the Electric Ordnance & Accessories Co., Birmingham (Vickers Lt.), and fitted on a Russian naval vessel.

The company are now building a number of triple expansion marine engines of 500 horse-power, the accompanying line drawing showing the general design. Further large contracts are pending. They have also specialized in ships' sidelights, marine type vertical boiler feed pumps, bilge and ballast pumps, also some special lines of brass work, etc. The name—Goldie & McCulloch has always stood for high class products and progress, and as might be expected they are in the forefront of the new Canadian industry of marine engineering.

COMPOUND MARINE ENGINES WITH CYLINDERS 12 IN. AND 26 IN. IN DIAMETER BY 16 IN. STROKE, BUILT BY THE JOHN McDOUGALL CALEDONIAN IRON WORKS, MONTREAL.

J. Coughlan & Sons, Vancouver, B.C.

J. Coughlan & Sons is a private enterprise, being controlled by J. Coughlan, a British Columbia pioneer, and his two sons J. J. Coughlan and S. H. Coughlan Prior to the war the firm was engaged in the sale and fabrication of structural steel for railway and highway bridges and steel frame buildings as well as in the manufacture of building bricks. They were highly successful in these spheres of commercial endeavor, having constructed almost all of the steel frames now standing in British Columbia in addition to a number of railway bridges.

The outbreak of war put a stop to the demand for specialties of the nature indicated, consequently new fields of enterprise had to be sought. Contracts were secured for six steel vessels of 8,800 tons deadweight capacity each, delivery of all to be guaranteed by the end of the year 1918.

It was found necessary to completely overhaul and re-equip the structural steel fabricating plant and in this regard no expense was spared, the result being that to-day the shipbuilding capacity of the yard will compare very favorably with any similar establishment north of San Francisco. Four keels have been laid down and construction work is proceeding simultaneously on

OCEAN-GOING WOOD SCHOONER CONSTRUCTION IN BRITISH COLUMBIA.

three of the vessels, the first of which will be launched shortly.

Each ship is to be steam turbine driven, contracts for the turbines having been placed in the United States. The boilers of Scotch type will, however, be built in the J. Coughlan & Sons' yard at Vancouver.

The firm is meantime giving employment to over 1,000 men and expectations are that before long as many more men will be on the pay-roll. The illustrations give a fairly comprehensive idea both of the extent of the plant and the magnitude of the work being carried out.

Early in December a contract for four more 8,800 ton freighters similar in all respects to the six already on hand was received from the Imperial Munitions Board.

Nova Scotia Steel & Coal Co., Trenton, N.S.

Although meantime engaged in the dual crafts of shipbuilding and marine engineering along with its other metal-working activities, no definite decision has been arrived at concerning the permanent establishment of either or both enterprises as part of the Nova Scotia Steel & Coal Co. future industrial programme. Two steel ocean-going steamships are at present under construction, and about the middle of the year a similar vessel was completed and sent to sea. The latter was steam turbine driven, while those now under construction will have regular type triple expansion surface condensing marine engines of "Scotia" manufacture.

It was hoped to have launched one of the vessels this fall, but shortage of labor made this impossible. As a result the launching will not now take place until the spring of next year. About 240 men are employed on the two ships now building, and something like 25 men are engaged on the engines at the New Glasgow plant of the company.

Port Arthur Shipbuilding Co., Port Arthur, Ont.

Early in the present year the Western Dry Dock & Shipbuilding Co., Port Arthur, Ont., gave place to the Port Arthur Shipbuilding Co. The capacity of the plant then was that of two 4,200-ton steel freighters building at one time, or an annual output of six vessels. Additional berths have since been constructed, which will about double the capacity, and there is little doubt but what full advantage will be taken of the enlarged accommodation to help relieve the shipping shortage.

The present year has been the biggest in the history of the yard as regards new construction, several ocean-going freighters and a number of deep sea trawlers having been completed and passed into service. The last official statement available showed a total of 16,267 tons of new construction on hand, of which seven cargo vessels represented 14,737 gross tons.

ACCOMMODATION AND RIGGING PLANS OF A FLEET OF FISHERIES PROTECTION VESSELS BUILT IN CANADA DURING 1917.

Collingwood Shipbuilding Co., Collingwood, Ont.

On January 2 this year transfer of the property of the Collingwood Shipbuilding Co. was made to H. B. Smith, J. W. Norcross, and R. M. Wolvin, the capitalization named in connection with the transfer being $2,000,000. During the present year nine steel vessels of a total of 15,000 gross tons have been built, launched engined and completed, the individual units consisting of one cargo steamer of 550 feet in length and 7,988 gross tons; two oil tankers, each 250 feet in length and of 2,642 gross tons; six deep sea trawlers, 125 feet in length and of 288 gross tons each. Several sets of engines and boilers were also constructed for vessels building elsewhere.

Needless to say the order books of the shipyard carry capacity on new construction well into the New Year which, taken in conjunction with anticipation of at least the average amount of repair work and overhauling, leads to the expectation that the ensuing twelve months will be the banner year in the company's history. It is of interest to note that from 1900, the year in which the shipyard was organized, until the present, 58 new vessels have been built.

		9				15,000					7,800		

Lyall Shipbuilding Co., North Vancouver, B.C.

The Lyall Shipbuilding Co., North Vancouver, B.C., have a contract to build six wood freighters for the Imperial Munitions Board, and not only have keels for all six been laid down, but one of the six took the water during the present month. As regards shipyard equipment, travelling derricks have been installed, and in the matters of a mill and small tools, these have been provided with a view to securing rapid and efficient output in every case.

M. Beatty & Sons, Welland, Ont.

This old-established concern on the Welland Canal have leased their shipyard and plate shop to the Welland Shipbuilding Co., who are building two standard steel steamships, and are understood to have other orders on hand.

M. Beatty & Sons' principal product at the moment consists of cargo winches, anchor windlasses, and ash hoists. In addition to building these to the order of the Imperial Munitions Board, they are also supplying them to the order of private shipbuilding interests throughout the Dominion.

They have not yet gone into the building of propelling engines or boilers, their equipment for turning out the larger horse powers at least being scarcely heavy enough. The building of marine engines for vessels of 1,000 tons and under is, however, under consideration.

Canadian Government Shipyard, Sorel, Que.

The Canadian Government shipyard at Sorel is under the direction of the Department of Marine and Fisheries, Ottawa, and aside from new construction, much repair work on the various units of the

COMPOUND SURFACE CONDENSING ENGINES FOR FISHERIES PROTECTION VESSELS.

MOTOR SHIP "CHIRALITE" AS SHE APPEARED ON HER TRIAL TRIP AT VANCOUVER.

St. Lawrence River ship channel fleet and on the Department of Public Works vessels in the district is undertaken the year round. Construction of buoys for the Department is another direction in which the activities of the plant tend, buoys of various designs being shipped to waterways in all parts of the Dominion. During each winter the St. Lawrence ship channel fleet, embracing 15 dredges and attendant vessels—about 100 in all, are wintered at the sorel plant, where repairs are made and the different vessels are overhauled and outfitted for the following season of navigation.

The new work completed during the present year includes the following: Steel staff tug "Berthier" for the St. Lawrence Ship Channel. Length, b.p., 120 ft.; breadth molded, 24 ft.; depth molded, 12 ft. 6 in.; gross tonnage, 368; indicated horsepower, 550; speed 13 miles per hour. The propelling machinery which is of the twin screw compound surface condensing type was, along with the boiler, built at the shipyard.

Steel steamer "Argenteuil," built for buoy service on the Ottawa River: Length over all, 100 ft.; breadth molded, 21 ft.; depth molded, 9 ft.; gross tonnage, 175; indicated horsepower, 190; speed, 10 miles per hour. The machinery is of the single screw compound jet condensing type and was purchased outside. The boiler was, however, built at the shipyard. A winch and derrick for handling buoys up to 6 tons is installed.

Three wood and three steel vessels were built for the Imperial Government. Boilers for the former, and boilers and engines for the latter, were also constructed at the shipyard. All of these have been delivered except one steel vessel which is in the water, but cannot be completed until the opening of the 1918 season of navigation. During the present year an average of 800 men have been on the payroll, their efforts being directed to both new and repair work.

Thor Iron Works, Toronto

At the Thor Iron Works, Toronto, new vessel construction has embraced two ocean-going steel stamships and two steel deep-sea trawlers. One of the former and the two latter were launched and completed during the year. The second freighter will be launched early in January. The trawlers are similar in every respect to those built at Collingwood and by tre Polson Iron Works, in which circumstances it will be unnecessary to feature them here. The freighters were ordered in the first instance by the Great Lakes Transportation Co., but changed hands later. Their leading dimensions and propelling machinery details are as follows: Length over all, 261 ft.; beam, 43 ft. 6 in.; depth, 28 ft. 2 in.; d.w., 4.300 tons; engine cylinders, 20-33-54 in. in diameter by 40 in. stroke; two boilers each 14 ft. 6 in. in diameter by 11 ft. long; indicated horsepower, 1,300.

Contracts on hand consist of two freighters similar in every respect to the above except htat they will be of American registry. By the end of January it is expected that the keels of both will have been laid. The machinery for all of the vessels is being taken care of by the John Inglis Co., Toronto.

Taylor Engineering Co., Vancouver, B.C.

The Taylor Engineering Co., Vancouver, although really naval architects and consulting engineers have during the past two years constructed a number of small wood craft all under 100 ft. in length, the most notable being the motor ship "Chiralite," a photograph of the vessel appearing in this section.

The "Chiralite" is 85 ft. over all and has a beam of 18 ft. Being intended to enter fairly shallow water ports, her draft loaded has been kept down to 6 feet. She was contracted for by the International Petroleum Co. for service off the South American Coast. Her motor equipment consists of two sets of 70 horsepower Sterling engines. On her trial trips she developed a sped of 9½ knots. The fuel capacity amounts to 2,400 gallons, being sufficient to keep the machinery running continuously at full speed for two weeks. The vessel is lighted throughout from a Delco electric plant installation. Electric fans are installed in every cabin and state room, also in the engine room.

Muir Bros. Dry Dock Co.

Muir Bros. Dry Dock Co., whose plant is located at Port Dalhousie, the Lake Ontario end of the Old Welland Canal, report a busy season, repair work having been abundant to the extent that their two dry docks have been employed more than ever, especially by the larger class of vessels using the Welland Canal highway of Great Lakes shipping. These dry docks have probably a longer record of continuous business than any others on the lakes, having been owned and oper-

OCEAN FREIGHTER "ANGOULEME," BUILT AT THE THOR IRON WORKS, TORONTO, 1917.

ated by one family since 1850. The company has so far not revived its shipbuilding, but has confined its entire efforts of late years to repair work, mostly in wood, although steel vessels have often been docked for minor repairs.

The two dry docks which have been rebuilt within the last two years, are at 255 ft. and 185 ft. keel lengths respectively, the former of which is sufficient to accommodate the longest ships able to pass through the canal. The shipyard adjoining the docks is modernly equipped, the unit installation consisting of a mill for sawing timbers, frames, etc.; compressed air plant, forge, machine shop, etc. The various buildings are nearly all of brick and stone construction with metal roofs, and the yard has suace for shipbuilding should Muir Bros. or some other firm acting with them decide to take up same.

Polson Iron Works, Toronto

Polson Iron Works, Toronto, in common with other Canadian shipbuilding establishments, has experienced an abnormally busy year. The launches for the period include one 3,500 gross ton ocean-going freighter and ten deep sea trawlers. Four freighters similar to the above are under construction, and one of them will be launched in January of next year. During the past twelve months the shipyard has been generally enlarged and extended, so much so that notwithstanding the good tonnage output, as shown on the accompanying table, a very much better one is expected in the ensuing year. It should also be stated that in addition to the shipbuilding feature the propelling machinery, including boilers, is also constructed at the plant.

British Yukon Navigation Co., Vancouver, B.C.

Although the British Yukon Navigation Co. are not in the shipbuilding business but operate a fleet of boats on the Yukon River and the Atlin Lake, nevertheless during the present year they built two vessels for the latter service. One was of the composite freight and passenger type carrying about 100 tons of cargo on her freight deck and 85 first-class passengers on her saloon and texas decks. She was a stern-wheeler, 165 ft. long, by 35 ft. beam, and was propelled by engines of 16 in. cylinder diameter by 72 in. stroke.

The other vessel was for day service only, therefore had no sleeping accommodation. She was 85 ft. long and of 20 ft. beam, and was driven by twin screws operated through 280 horsepower Buffalo gasoline engines. The average speed of both vessels is 13½ miles per hour. No new construction is contemplated for the coming year.

John McDougall Caledonian Iron Works, Montreal

In common with other important and old established general engineering concerns in Canada, the John McDougall Caledonian Iron Works, Montreal, have taken up the manufacture of marine propelling engines, boilers, and engine room auxiliary equipment. A detail of the work completed and in progress follows:

Six sets of compound engines with cylinders 12 and 24 inches in diameter by 16 inches stroke, of 210 indicated horsepower each.

Six marine Scotch type boilers each 9 ft. 6 in. in diameter by 9 ft. long.

Six sets of ships' side valves.

Six sets of surface condensers of 400 sq. ft. C.S. each.

The foregoing have all been completed, delivered, and installed.

The work on hand and in progress consists of:—

Two sets of triple expansion engines with cylinders 12¾, 21½ and 35 inches in diameter by 24 inches stroke, of 560 indicated horsepower each.

Two sets of ships' side valves.

Two surface condensers of 600 sq. ft. C.S. each.

Two sets of triple expansion engines with cylinders, 20, 33 and 54 inches in diameter by 40 inches stroke, of 1,250 indicated horsepower each.

Two condenser circulating pumps independently driven by vertical marine type engines.

Two sets of 1,750 I.H.P. triple expansion engine castings, the cylinders of which are 21, 35 and 67 inches in diameter by 54 inches stroke.

Canadian Vickers Ltd., Montreal

The shipbuilding plant of Canadian Vickers, Montreal, easily takes precedence of all others in Canada both as regards the amount and nature of the operating equipment, extent of layout, etc., and the scope, weight and variety of vessel product capable of being turned out. Unfortunately little data is available concerning the activities of the present year; it may be affirmed, however, that merchant and naval vessel construction (new and repair), have not been lacking. We are safe in saying that more men are employed by Canadian Vickers than by all the other shipbuilding yards of the Dominion combined, a condition likely to prevail permanently, irrespective of what future development may take place in the industry within our borders.

On November 29 the ocean freighter "Porsanger" was launched, and the opening of the 1918 season of navigation will see her sister ship take the water. Both vessels are on order to Norwegian account and are of the following leading dimensions, etc.: Length over all, 394 ft. 6 in.; breadth molded, 49 ft. 3 in.; depth molded, 30 ft.; deadweight capacity, 7,000 tons; gross tonnage, 4,670; load draught, 24 ft. The propelling machinery consists of triple expansion engines, two main and one donkey boilers. The hull subdivision embraces 14 separate water-tight compartments, while a double bottom extends fore and aft throughout each ship's length. The water ballast capacity is 1,630 tons. Cargo handling, navigating and lighting equipment installed are of the most modern and efficient type.

The plant is meantime taxed to capacity in the matter of keels laid, notwithstanding the big extensions and additions to buildings and equipment that have been made during the year.

Fraser, Brace & Co., Montreal

Among recently established wood shipbuilding plants, attention may be directed to that of Fraser, Brace & Co., of Montreal. Although a new departure for this firm, they go into it with a wide expert knowledge of large construction work and engineering undertakings generally. They have acquired a very desirable location for the plant site, which consists of approximately eight acres adjoining the Lachine Canal, on the south side of the latter and in the district known as Cote St. Paul. The shipyard offers ideal conditions for its specific purpose, forming an old basin that is readily and rapidly being transformed into an excellent slip or dry dock. When this basin was formerly used, the entrance was bridged by the bascule bridge on the C.P.R. which runs parallel

to the canal; the abutments for the bridge being of concrete. The dam that at present prevents the water of the canal from entering the basin will eventually be replaced with a lock gate, so that the basin will form a dry dock 600 feet long and 150 feet wide; sufficiently large to provide erection and working space for four wood ships, each of which will be 250 feet long and of 42 feet beam.

The initial contract secured is for four standard 2,500 ton boats, and construction is now well advanced for two of these the keels being placed on the pile foundations which have been laid on the eastern bank of the slip. The first two will be side-launched when completed. The keels for the other two will be laid in the bed of the slip, and when the boats are finished they will be floated by simply flooding the slip, water being allowed to pass through the canal entrance. This method will eliminate the construction of launching ways and will also facilitate the actual "launching" operation.

A tentative contract has been obtained for other four boats of the same class, and provision is being made to accommodate the entire eight at the one site; four in the slip and the remainder on the upper level. Buildings have been erected for offices, stores, air compressors, transformers, saw mill, also carpenter and machine shops. A mold loft 150 feet by 50 feet has also been provided. The power used throughout will be electric. The property adjoins both the G.T.R. and the C.P.R., admitting of facilities for the handling of materials promptly and direct to the job.

It is anticipated that within a few months Fraser, Brace & Co. will have a force of about 600 men employed as the first four boats are to be delivered by the middle of 1918. Their contract covers the building of the hulls only, the installation of propelling machinery, general equipment and the interior fittings being taken care of by other contractors.

The Foundation Co., Victoria, B.C.

The Foundation Co. with shipyard at Victoria, B.C., have contracts on hand for five 2,500-ton wood ships and in view of the fact that virgin ground was broken for construction purposes, it may occasion some surprise when we state latest advices give indication of some real live progress.

Wallace Shipyards, North Vancouver, B.C.

The Wallace Shipyards at North Vancouver, started the present activity on that part of the Pacific Coast. The original programme called for the construction of six auxiliary powered schooners for the Canada West Coast Navigation Co., all of which, according to our information are now completed. Later the order to build a similar vessel was received from the Federal Government, its particular service to be for the most part between the Atlantic and the Pacific. Arrangements were next made for the building of three steel setamships. One of these has been completed and is now in commission. Work on the second is well advanced and she will be launched early in the New Year. The outlook for the coming twelve months is unusually bright, the firm's order books showing contracts on hand to cover 4 cargo steamers of 17,500 combined gross tonnage.

Western Canada Shipyards Vancouver, B.C.

The Western Canada Shipyards with plant located on False Creek are building six wood steamships for the Imperial Munitions Board, and good progress has already been made on two of them.

Cameron-Genoa Mills Shipbuilders, Vancouver, B.C.

This firm have all but completed the contract they had on hand early in the year for six auxiliary powered schooners for the Canada West Coast Navigation Co., as a result they are now devoting almost their whole attention to the building of 4 wood steamships for the Imperial Munitions Board.

Grant & Horne, St. John, N.B.

The young general contracting firm of Grant & Horne, have gone into the business of wood shipbuilding at Courtenay Bay, St. John, N.B., a contract having been received from the Imperial Munitions Board for two wood steamships of 2,800 gross tons each. Latest reports indicate good progress, present anticipations being that the first vessel will take the water in the early spring of next year.

D. A. Saker & Co., West St. John, N.B.

The wood shipbuilding plant of D. A. Saker & Co. is located on what is known as the Straits Shore, West St. John, N.B. The necessary buildings have been erected and the equipment installed. One wood auxiliary powered schooner is at present under construction, her length being about 180 feet. She is not under contract, it being the intention of the builders to sell her while on the way or after completion.

Pacific Construction Co., Coquitlam, B.C.

The Pacific Construction Co. has taken over the plant of the Coquitlam Shipbuilding Co. at Coquitlam, B.C. and are there engaged in turning out two wood steam freighters of 2,800 gross tons each.

Montreal Dry Dock Co., Montreal, P.Q.

The Montreal Dry Dock Co. has experienced a year of unusual activity, the greatest trouble having been to furnish the necessary docking facilities to meet the demand. Shortage of skilled labor operated towards a prolongation of the time spent by vessels when in dock, thus aggravating the situation still further.

Hall Engineering Works, Montreal, P.Q.

Marine repairs both ship and engine continue to be a feature of the activities of the Hall Engineering Works, Montreal, so much so that notwithstanding the lesser number of ships using the harbor of the Canadian Metropolis than was the case in normal or peace-time years, due in large measure to fewer of them being available, the past twelve months appears to have been about the busiest of any similar period since the enterprise was established.

Kingston Shipbuilding Co., Kingston, Ont.

The Kingston Shipbuilding Co. in addition to at least its normal amount of repair, overhaul, and dry dock activities, built and completed two deep sea trawlers similar to those referred to elsewhere. The dry dock at Kingston is owned by the Federal Government and is leased by the Kingston Shipbuilding Co., the latter being somewhat in the nature of a subsidiary of the Collingwood Shipbuilding Co.

Dominion Bridge Co., Montreal, P.Q.

The Dominion Bridge Co. in addition to active participation in munitions production on its own behalf and that of its subsidiaries has also interested itself to a very great extent in the marine engineering side of the shipbuilding activity now so widespread throughout the Dominion. Not only has marine engine and boiler building been undertaken on a big scale, but an interest has been secured in the International Engineering Works, Amherst, N.S., where marine engine work has been in progress for some several months. Judging from the enterprise record of Dominion Bridge in the past, it may not be too much to expect that before the coming year is very old the scope of operations on marine specialties will tend to dwarf in many instances otherwise effort.

AUXILIARY POWERED SCHOONER LAUNCHED

WITH the Governor-General, the Duke of Devonshire, Lieut.-Governor Barnard and a host of other notables looking on, the auxiliary wooden schooner Beatrice Castle took the water on the morning of November 23 from the launching ways at the Cameron-Genoa shipyards.

Workmen engaged in shaping the big wooden hulls on adjacent slips paused while the vessel, released from the holding wedges, received its baptism of the sea, and, with hats raised, cheered lustily as the schooner, with bunting and the Union Jack waving, backed out into the Inner Harbor and was taken under escort by the waiting tugboats. The Beatrice Castle was the sixth and last schooner built under contract with the Canada West Coast Navigation Co.

The ceremony took place at 9.45 in the morning, and several minutes before the scheduled time the care carrying His Excellency and Lieut.-Governor Barnard, with Mrs. Barnard, and H. J. Muskett, his private secretary, reached the yards. The Governor-General's suite, composed of Lord Richard Neville, Col. Henderson and Capt. Rivers-Bulkley, also witnessed the launching. When the final blocks were cleared away, Mrs. H. W. Brown broke the tradition bottle of champagne across the bow of the retreating vessel.

New Canadian Plant of Butterfield & Co., Rock Island, Que.

Staff Article

Numerous metal-working plants which in pre-war days were recognized as leaders in specific lines of manufacture have, as a result of the happenings of the past three years, not only added to their former reputation and become more firmly established but, through the mediums of new and enlarged factory buildings and the installation of high-class, up-to-date equipment, have placed themselves on record as being out to cater to the needs of that much wider field generally anticipated when the clash of arms and the roar of guns ceases.

THE plant of Butterfield & Company, located on the border line between Canada and the United States, at Rock Island, Que., and Derby Line, Vt., was established in 1880 by Col. F. D. Butterfield; the initial structure consisting of a two-storey building 60 ft. by 40 ft., located about one-third of a mile from the site of the present factory. About the year 1890 the Colonel's brother, Frank G. Butterfield, and several others, became associated with the firm, as a result a company was incorporated in 1897. From that time the growth of the business has been quite rapid, the name Butterfield & Co. becoming a household word in the field of mechanical engineering. In 1913 the Union Twist Drill Co. of Athol, Mass., bought out the entire stock of both the Canadian and United States branches; all business, however, continued to be carried on under the former name of Butterfield & Company.

With the plant operating at capacity previous to the opening of the war, it was natural that with the enormous demand for small tool equipment following the placing of shell orders in Canada, an added impetus was given to the manufacture of drills, taps, dies, milling cutters and numerous other small tools.

Recent Development

It was more than evident, during the first year of the hostilities, that the capacity of the then existing plant, operating day and night, would be inadequate to the abnormal situation. Steps were therefore immediately taken towards enlarging the factory to take care of the ever-increasing business that was being virtually thrust upon them.

The Canadian plant was finished a few months ago, and with possibly one or two exceptions is now completely equipped with all the necessary machinery for the production of a full line of product. The buildings are all of reinforced concrete and brick construction, absolutely fire-proof, and having exceptionally spacious windows with pivoted steel sash; the structure throughout representing the most modern type of machine shop design. The main building, 175 ft. by 70 ft., is three storeys high with an 8 ft. basement under the entire ground floor. The basement is used for storage of lubricating oils, etc., and also contains the pumping units for circulating the brine used for hardening purposes. The brine tanks are so designed that the to suit the requirements of small or large production, an essential factor where variable quantities of tools are being handled.

NEW THREE-STOREY ADDITION TO CANADIAN PLANT OF BUTTERFIELD & CO., ROCK ISLAND, QUE.

Beneath the polishing room is located a large Canadian Buffalo Forge Co. exhaust fan which takes all the particles of emery and steel dust from the various grinding and polishing machines and discharges same into a large concrete vault installed in the basement.

Transmission Facilities

Electric power is used throughout for the operation of the machinery in the various departments. This power is purchased from the Sherbrooke Railway & Power Co., and is delivered to the plant at a voltage of 22,000, and transformed to a voltage of 550 and 110 for power and lighting respectively. All machinery is driven on the group or line shaft system, the motors being invariably suspended from the ceiling; this method providing increased floor space for manufacturing purposes, and also avoiding the use of inclined belts that are often a source of annoyance and accident, when motors are located on the floor or semi-elevated platforms.

A notable feature in connection with the transmission installation in this plant is the method adopted for the erection of the various line and counter shafts. In the construction of the different floors, suitable appliances were imbedded in the concrete and secured to the reinforcing members to support small I beams and angle irons that could be located on any section of the ceiling where shafting was required. The advantages of this method are at once realized, as facilities are provided for rapid and labor saving adjustment or erection of additional transmission equipment.

The entire first floor is devoted to the manufacture of all types of milling cut-

OLD FACTORY OF BUTTERFIELD & CO., ROCK ISLAND, QUE., NOW USED AS OFFICES AND SHIPPING ROOM.

ters, while the second floor is equipped for the production of twist drills. These two lines are the most recent departure of the Butterfield Co., the Canadian plant not being equipped for this work when brought under the control of the Union Twist Drill Co. This, however, does not imply that the Canadian product is in the hands of novices; on the contrary, the manufactured article of the Rock Island plant is equal in every respect to that produced in Athol, Mass., as the work is under the direct supervision of experienced engineers from the parent concern.

The third or top floor of the main building is used for the manufacture of the original line of Butterfield taps, dies, reamers and screw plates. Machinery on all three floors has been especially designed for the tools made in the particular departments. The annex, a one-storey building 175 x 70 ft., is utilized for the storage of tool steel stock; the cutting-off machines, forge department, electric welding and annealing furnaces, hardening and tempering, and the polishing and finishing departments are also embraced.

Routing and Inspection

In the arrangement of each department careful attention has been given to the systematic placing of the machines to avoid "overlapping" when routing the semi-finished work in process of production; thus eliminating the loss of time and possibility of confusion that ultimately results when this important detail is not given the proper consideration. Efficiency is not so much dependent upon the saving of time on an actual operation, as on the effective methods adopted for minimizing the expense in the "unproductive" handling of the material between succeeding operations. All tools, whether taps, dies or cutters, start in the cutting-off department where the blanks are sawn off from bar stock. From there they pass through the various departments in rotation as the different operations are performed, until they are placed before the final inspectors. When work is passed as entirely satisfactory both as to finish and accuracy, it is transferred to the shipping department where it is packed and crated.

It might be here mentioned that in addition to the rigid inspection given every finished tool, each individual piece is carefully examined between each detail operation. This not only eliminates useless machining on spoiled or defective work, but assists in keeping a check upon the different workmen and machines. While the quality of the product of this plant is largely dependent upon the special design and accuracy of the machinery used, the equipment is not "fool proof," and therefore the human element must be considered when efficiency is the watchword. It is therefore imperative that, apart from the possibility of neglect or carelessness on the part of the operator, the output of each machine be carefully and constantly examined to avoid the multiplication of errors or mistakes of either the men or the machines.

Each batch in process, be it large or small, is accompanied by a production slip that is checked and verified by every intermediate inspector, so that every piece of spoiled or defective work can be traced to the man or machine responsible, and steps taken to rectify the trouble. The system is so effective that it is a rare thing for the final inspectors—and they are almost infallible—to detect a fault in the work delivered to them. Owing, however, to the fact that we are all human, occasion will arise when a slightly defective tool will find its way to the shipping department, but this possibility is very rare indeed.

Hardening and Tempering

Special mention might be made of the very elaborate hardening and tempering system that has been installed. The various lead baths and oil-fired hardening furnaces, also the oil tempering vats, are each provided with suitable pyrometers to guide the operators in the accurate regulation of the temperature for the particular grade of steel and type of tool. Another feature of this department is the installation of automatic electric timing devices to insure the proper amount of heat treatment to suit the purpose for which the tool is to be used and the degree of hardness required in relation to its particular size and shape; thus leaving nothing to guesswork. It is claimed that this is the most complete and scientifically equipped hardening room of any plant in Canada.

Plant Features

An outstanding feature in connection with every department of the plant is the absolute cleanliness. Wholesome environment contributes much to the health, not only of the body but also to the mind of employees, who readily adapt themselves to conditions that are conducive to maximum production and general efficiency. The average height of each floor is about 20 ft., giving ample room for overhead shafting and effective ventilation. Walls and ceilings are of mill white to reflect the light in such a manner, both by day and night, as to avoid excessive shadows in any section of the room. Artificial lighting is by tungsten drop globes, arranged for uniform distribution. Office lighting is by the indirect nitrogen filament system.

Wash rooms, cloak rooms, and toilets are provided on each floor. In each department first aid equipment has been installed for emergency purposes. It is also planned to remodel a section of the basement now unoccupied into employees' recreation room. In addition to the fire-proof character of the buildings, each floor is provided with stand-pipes fitted with a length of fire hose, always readily accessible. The office building is equipped with a sprinkler system, water supply for this purpose being obtained from the city reservoir located on one of the adjacent hills, which gives a head of approximately 140 feet. All other water used on the premises is pumped from driven wells and distributed by one of the now well known pneumatic systems.

The original unit of the present factory, built in 1890, consisted of a two-storey concrete and brick building, 100 ft. by 30 ft., and is now used as the main offices and the shipping room, the latter being on the ground floor. The L section adjoining this building was added in 1903 and is now utilized as the source of the heating system, which consists of the forced circulation of hot water, generated in two 150 h.p. Leonard boilers; the working pressure for the system being between 100 and 135 lbs. per sq. in.

From what we can learn, business is growing so rapidly that it is only a question of a little time before additional buildings will have to be erected; provision has been made for this in the original plans. The company is now building a large addition to the existing plant in the United States, just across the border, which when completed, will be almost a counterpart of the Canadian plant adjoining.

JAPANESE SHIPBUILDING SUBSIDIES

H.M. COMMERCIAL Attache at Yokohama (E. F. Crowe, C.M.G.) has forwarded a translation of a Japanese law, which is of considerable interest to shipowners and shipbuilders both in Japan and elsewhere. The law relates to the suspension of shipbuilding subsidies, and was passed at a recent special session of the Japanese Diet.

Mr. Crowe writes that the Shipbuilding Encouragement Law, which came into force in 1896, and was amended in 1910, gave a powerful impetus to shipbuilding in Japan, and the advent of the European War greatly accelerated development of the industry. The unprecedented prosperity which is now ruling in shipbuilding circles in Japan can only be ascribed to the abnormal conditions brought about by the war. All the private yards have earned very considerable profits, and there is every indication that the number of shipbuilding concerns will be largely augmented in the near future.

In view of the profits now being made, the opinion has frequently been advanced that the time had come to abolish the subsidies granted to shipping and shipbuilding, and this feeling has been accentuated by the fact that within the past few months many of the vessels recently constructed in Japan have been transferred to foreign ownership, which no doubt gives rise to a belief that, under present conditions at least, when tonnage is at such an extravagant figure, the Japanese taxpayer is being taxed for the benefit of the foreigner. For the present, however, the diet in this new law has confined itself to cutting off subsidies conferred on vessels which are sold to foreign owners.

Year's Building in Montreal.—Up to December 19, building permits numbering 1574 of $4,348,873 value were granted during the year 1917, as against 1880 permits value $5,333,204 in 1916. No great change either way is anticipated in the coming year.

By the Editor

The uncovering and reclamation of Canada's mineral resources contribute no insignificant chapter to her national development progress. The subject matter of the accompanying review prepared from official records for the Mail and Empire's Special Trade Expansion Number points to such a conclusion. Following a general reference to the Dominion production as a whole, the hidden wealth of each Province is discussed in its variety detail.

RESEARCH into and the utilization of Canada's natural resources have made gigantic strides during this war-time, and so far as our mineral wealth is concerned there is little doubt, judging by the achievement of the past three years, that its expeditious and profitable extraction is not only assured, but what is of greater importance, its reduction to a state which admits of easy adaptation to the needs of metal-working and kindred industries within our borders is in process of being satisfactorily solved. The designation, Canada's mineral wealth, is no misnomer, and in proof of same, the classification content which follows should be ample evidence.

Metallic Products — Aluminum, antimony, cobalt, copper, gold, iron, lead, mercury, molybdenum, nickel, platinum and palladium, silver, tin, tungsten, zinc.

Non-Metallic Products.—Abrasive materials. Actinolite, alunite and pyrophyllite, arsenic, asbestos, barytes, chromite, gypsum, magnesite, manganese, mica, mineral pigments, mineral water, natural gas, peat, petroleum, phosphate, pyrites, quartz, salt, talc.

Structural Materials and Clay Products.—Cement, clay products, lime, sand-lime brick, sand and gravel, slate, stone. Numerous minerals of economic importance occur, widely distributed, in the Dominion of Canada, although even yet only fractions of the probable productive areas have been carefully prospected. Within her boundaries Canada still possesses large areas of great potential importance, and each season is bringing to light new deposits not hitherto uncovered.

Mining Lands and Rights

The conditions under which mining lands or mining rights may be acquired in Canada are not uniform throughout the country, but vary with the different provinces. This is due to the fact that, with certain exceptions, Crown lands or mining rights are owned or controlled by the provinces, and each of the latter sells or leases mining lands or mining rights according to its own laws or regulations. The exceptions are the Provinces of Manitoba, Saskatchewan, Alberta, the Yukon and North-West Territories, the public lands of which are still held by the Federal Government at Ottawa, and are leased or disposed of under Dominion regulations. In certain of these exceptions, the Province, although not controlling the land or mining rights, exercises control over the mining operations; thus the Province of Alberta administers the coal mining regulations, and appoints provincial inspectors for the carrying out of the law. In nearly every case where provincial control is exercised, the making of annual returns is required. There are, however, some provinces in which there is practically no local record and in which the local record covers only certain products.

COMPARATIVE CANADIAN MINERAL PRODUCTION, 1867-1917.

Although the mining of gold and coal and probably a few other minerals had been in progress for many years, it was not until 1886 that any comprehensive record of Canada's annual output or mineral production became available. Statistics of gold mining in British Columbia have been procurable since 1858, and in Nova Scotia since 1850, while statistics of coal sales in the latter have been recorded since 1785. The compilation of records of production of minerals of lesser importance had apparently, however, been given little attention.

Development Grows Apace

In 1886, the total mineral production of the Dominion of Canada was valued at $10,250,000 of which $2,250,000 was for non-metallic structural materials and clay products. Of the balance of $8,000,000, over 70 per cent. was made up of gold, coal, and petroleum; while another 20 per cent. consisted of copper, silver, asbestos, phosphate, and salt. Seven years later, in 1893, production had increased in value to rather over $20,000,000, made up of a little over $5,000,000 in building materials and clay products generally, $10,000,000 in other non-metallic minerals, chiefly coal and petroleum; and a little less than $5,000,000 in metallic minerals, nickel, copper, gold and silver being the more important.

In the immediately succeeding years, the metalliferous ores in British Columbia began to show substantial development. The nickel deposits of the Sudbury district of Ontario had been opened up and were being operated with annually increasing output, while the discovery of the rich gold placers of the Yukon in 1896 resulted in a heavy increase in an already growing mineral production.

Our coal mining industry has made wonderful strides, not only in the Western Province, where new mines are be-

ing regularly opened up, but also in Nova Scotia, where the growth of large steelmaking enterprises makes a necessarily heavy demand on coal supplies. The extension and development of our railroad systems have also exerted a stimulating influence on the mining of coal.

In the realm of metallic ores, the development of the large deposits of low-grade copper ores of the Boundary District of British Columbia deserve special mention, resulting as they have in a large and important production of copper from that territory. The discovery and shipment of the rich silver ores from the Cobalt District of Ontario contributed very materially to the enhancement of mineral output values during the last decade.

The growth of the country both in population and industrially has resulted in great activity in the development of non-metallic structural materials and clay resources, while the manufactures of cement, brick, and lime, and the quarrying of stone are growing yearly in value. From 1895 to 1899, the total mineral production increased from a little over $20.000,000 to $50,000,000, and to nearly $66,000,000 in 1901. During the next three years, the output was somewhat less, but increased again in 1905 to nearly $70,000,000. In 1910 the production value passed the hundred million mark, the figures for that year showing the substantial total of $106,-823,623. As showing, however, what real intensive application to the development of our mineral resources has accomplished, it is only necessary to state that in 1913 the output value reached $145,634,812, and that for the year 1916 the hitherto unapproached value of $177,357,454 was realized. Anticipations for the present year, based on the available records of the months already gone, are that the $200,000,000 mark will be comfortably passed.

Having in the foregoing dealt with the mineral production of the Domionion as a whole and in a general way, it seems advisable to discuss the resources of each individual province and by so doing demonstrate the contribution the latter make in kind and value to the yearly grand total.

PROVINCE OF NOVA SCOTIA

As far back as 1672, Nova Scotia was known to possess important mineral deposits, but they only began to attract attention in the first part of the nineteenth century, while their exploitation to any considerable degree dates practically from 1830, when the first deep shaft of the General Mining Association was sunk in a coal seam. Statistical records of mining in this Province date back to eighty-two years before Confederation.

In the report of the Chief Gold Commissioner for the year 1862, the statement is made that "the earliest discovery of gold in the Province made known to the public, occurred during the summer of 1860 at a spot about 12 miles north from the head of Tangier Harbor." At this time, coal mining was a fairly well established industry. From these early beginnings, the development and working of some of the mineral deposits have been actively carried on, while others, although promising, still remain undeveloped. Coal constitutes the main mineral product of the Province. The carboniferous formation occupies a large portion of Nova Scotia, covering over half the area of Cape Breton Island, as well as a large part of Cumberland, Pictou, and Hants Counties. Four important coalfields have been developed, viz.: Sydney, Cumberland, Pictou, and Inverness.

The Maritime Provinces, owing to their geographical position on the Atlantic seaboard, were the first in Canada to have their mineral resources explored. In mining, but more especially in the production of bituminous coal, Nova Scotia has for over 200 years had an enviable reputation; while its gypsum deposits, which are among the most extensive in existence, may be said to be only in the primary stages of development.

In addition to these particular resources, an appreciable commerce is carried on in the metallic ores of iron, gold, and antimony, also in minerals of economic value such as dolomite, limestone, fluorspar, and other materials employed in metallurgical processes, besides clays, building stones, etc. In the manufacture of steel on a big scale and by means of the most approved methods, Nova Scotia has shown and continues to show commendable enterprise.

The initial attempt to mine coal was made in the year 1720, it having become necessary to procure a supply of fuel for the men who came from France to lay the foundations of the fortress at Louisburg. The pit openings then made can still be seen at Port Morion, Table Head, etc.

Intensive Development of Resources, Etc.

To the Nova Scotia Steel & Coal Co. and to the Dominion Coal Co. belongs the credit for the development of the coal resources of the Province. On February 1, 1893, the Dominion Coal Co. was organized with a capital of $18,000,000. This corporation amalgamated the coal properties of the south side of Sydney harbor, Cape Breton. With the advent

*The total production for the years 1785 to 1873 is made up as follows:—
Nova Scotia (1785 to 1873) ..... 8,053,670 tons of 2.000 pounds
British Columbia (1836 to 1873) ..... 538,480 tons of 2,000 pounds

of this big industrial enterprise, a new era in Nova Scotia coal mining began. Mine workings , railway extensions, shipping and discharging facilities were developed, old coal markets expanded and new ones opened up, the result being that the whole coal outlook of the Province was revolutionized. In the first year of the Company's operations (1893), the coal mined amounted to 826,208 long tons, from 8 collieries. As showing the development that has taken place in the interval, the output of 1914 may be cited, the total for that year being 4,800,000 long tons from 20 collieries operating. Due to the labor scarcity since 1914, arising from enlistments, lessened outputs have been the rule, hence the insertion of that year by way of comparison.

In 1900, the Nova Scotia Steel & Coal Co. acquired the later mining rights of the General Mining Association already referred to, and in addition to operating the existing collieries, have opened up new mines, erected iron and steel works which include blast and open hearth furnaces, coke oven plant, etc., all in close proximity to the working collieres. Their Princess Pit was in 1873 the first submarine mine in North America, the coal being won from workings under the sea. The shafts are of unique construction, consisting of metal cribbing or tubbing.

Some six years after the Dominion Coal Co. had been in operation, the necessity for a larger market for its product was realized. Steps were therefore taken by a number of the principal shareholders to establish a steel and iron industry in the vicinity of the coalfields. The advantage, it was believed, would be specially marked during the winter season, as a sure market for a considerable portion of the output would be provided, whereas, after the close of navigation on the St. Lawrence, if the mines are not closed down altogether, it is necessary to bank the produce.

In consequence, the Dominion Iron & Steel Co. was incorporated under the laws of Nova Scotia Province in March 30, 1899, with an authorized capital stock of $20,000,000 common stock and $5,000,000 preferred stock, the par value of each share being $100. A site for the plant was secured within the city limits of Sydney, Cape Breton, which comprises an area of 440 acres. It was valued at $83,000, and was given to the company as a bonus by the city of Sydney. In recent years, the Dominion Steel and Dominion Coal Companies amalgamated under the title of the Dominion Steel Corporation.

The iron ores of Nova Scotia are not confined to any particular geological horizon. In fifteen out of the eighteen counties of the Province, iron ore of more or less extent has been located. Many of these discoveries have been just sufficient to tempt, but not sufficient to reward exploitation; others, again, are found to be valuable. The more important known deposits are those at Torbrook, Annapolis County, owned by the Annapolis Iron Co.; the Londonderry deposits owned and operated by the Londonderry Iron & Mining Co.; and the East River deposits, Pictou County, owned principally by the Nova Scotia Steel & Coal Co. As evidence, perhaps, of the general unimportance of the iron ore resources of the Province, it may be stated that both the Dominion Steel Corporation and the Nova Scotia Steel & Coal Co. derive their ore supply from their properties on Bell Island, Newfoundland.

The gold production of the Province which is derived almost entirely from quartz ores amounted to 6,863 fine ounces of a value of $141,872 in 1862, and reached a maximum of 30,348 fine ounces of a value of $6,627,357 in 1902. It then decreased gradually, reaching

1915	7,365,931	10,448
1916	9,012,202	11,040

in 1913 a minimum of 2,174 fine ounces of a value of $44,935. Since then, there has been a marked increase in output, and correspondingly in values, the latter showing $60,031, $157,180, and $103,359, for the years 1914, 1915, and 1916, respectively. It may be stated that the decrease in 1916 as compared with 1915 arose from water shortage which interfered seriously with the operation of the hydro-electric plants.

Miscellaneous Mineral Resources

Ores of manganese and barytes have been mined annually but in comparatively small quantities, while there has also been a fairly steady production of grindstone abrasives. Tripolite or infusorial earth deposits have been worked since 1896. From the clays of the Province, widely distributed, there is a substantial annual output of brick and tile products. Marbles, granites and sandstones of excellent quality for building and ornamental purposes are found in abundance, as well as limestone for building, fluxing, or lime-making. Cement and brick are made from blast furnace slag, and the slag is also used for the manufacture of fertilizer. The manufacture of coke is accompanied by the recovery of by-products, sulphate of ammonia, tar, and constituents of high explosives. Ores of tungsten, antimony, and arsenic, have been mined, and tin, lead, and copper ores have been found.

Annual Production of Manganese Ore.

PROVINCE OF NEW BRUNSWICK

The mining industry in the Province of New Brunswick appears to occupy as yet a comparatively unimportant position. Gypsum, coal, iron ore, manganese ore, sandstone abrasives, natural gas, petroleum, oil shales, together with limestone, building and ornamental stones of granite and sandstone, form the principal mineral resources, although the occurrence of other minerals has been noted from time to time. With the exception of the gypsum, brick and stone industries, and coal on a small scale, little has been done in the direction of development.

The lack of mineral development activity is, perhaps, hard to explain, except on the ground that attention hitherto has been almost entirely devoted to the great timber resources of the Province, hence little systematic demand for this ore is in the manufac- prospecting for minerals has been undertaken. Iron ores are found in the following localities—Woodstock, Carleton County, where the occurrence of hematite beds has been known since 1863; West Beach, St. John County; Black River, St. John County; Gloucester County on the Nepizguit River, 21 miles from the town of Bathurst.

Copper ores are found widely distributed throughout the Province, but with few exceptions little work has been undertaken. The occurrence of bituminous coal in the Province of New Brunswick has been known for over two hundred years, and while small, seams of more or less importance have been discovered in the interval, the most valuable area remaining is that known as the Grand Lake coalfield, which is situated 70 miles north of the city of St. John, in a direct line between Fredericton and Moncton, and 20 miles east of the former town. The total area of the field is 112 square miles.

The first discovery of antimony was made in 1863, at Prince William, York County, where it occures as sulphide of antimony—stibnite, and as native antimony. Many years ago, the property was worked by the Lake George Mining Co., and a small smelter was erected from which when in full operation a production of about one ton per week was maintained. Unfavorable market conditions and litigation over disputed claims forced the company into liquidation. The property is now owned and operated by the Canadian Antimony Co., we understand. It embraces an area of four square miles of mineral rights, and 440 acres in fee simple. The mineral rights include antimony, gold, and silver, free from royalty. The principal ture of babbitt metal and type metal; smaller quantities are used in enamelling, the manufacture of glass, rubber, and some varieties of paint. In this war-time, not a little antimony is finding a place as a munitions constituent.

The manganese industry of New Brunswick was at one time of considerable importance, but of late years it has not been quite so active, possibly for the reason that the largest known deposits are situated far from shipping facilities, and the cost of transportation is therefore excessive. The surface indications and geological conditions meanwhile justify the belief that in the future a considerable production of manganese will be possible from the mines of the Province.

(a) Exports.

PROVINCE OF PRINCE EDWARD ISLAND

This little Province, consisting of the island of the same name in the Gulf of St. Lawrence, has, practically speaking, no mineral resources or industries. It is uniformly fertile, is well peopled, and has important fisheries. Red sandstone suitable for masonry may be quarried in some places, and clays occur that may be used for brick-making. It may be that coal seams underlie the island or some part of it, but if so, they appear to be at a depth too great for meantime utilization.

PROVINCE OF QUEBEC

In the earliest historical records of the Province of Quebec, the references to mining are very meagre. In 1737, the right of mining and smelting iron ore in the district of St. Maurice, near Three Rivers, was granted to a company by Louis XIV., then King of France. From that date until recent years, the mining and dredging of bog or cake ore, the metallurgical reduction of same into pig iron, had been carried on at the Rednor and Drummondville furnaces as an important industry. Several other attempts to smelt iron ore on a commercial scale were made at Moisie in 1867; at St. Urbain in 1873; at Hull in 1867 and 1872; but with only partial success.

Quebec, with its boundaries extended to include the great north country of Ungava, reaching to the shores of Hudson Bay and Hudson Strait, is geographically the largest Province in the Dominion of Canada, but, as in all of the Central and Western Provinces, the settled or populated section is confined to a comparatively narrow fringe of territory along the southern border, the greater part of the northern area being for the most part unexplored.

Quite a variety of mineral products are to be found in Quebec Province, among which may be noted the following:— Zince ore, copper, gold, iron ore, silver, asbestos, feldspar, graphite, magnesite, mica, mineral waters, ochres and iron oxides, peat, phosphate, pyrites, quartz, cement, clay products, kaolin, lime, slate, stone, etc. In the southeastern portion of the Province, south of the St. Lawrence River, in an area known as the Eastern Townships, are to be found alluvial gold deposits, copper pyrites, asbestos, chromide deposits, bog iron ores, also large marble and granite quarries. North of the St. Lawrence are bog iron ores at Three Rivers, and titanium ores north of Montreal, while further west, and north of the Ottawa River, are to be found magnesite, graphite, phosphate, feldspar, mica, barytes, iron ore, and molybdenite, with lead and zinc at Notre Dame des Anges, Calumet Island, and near Lake Timiskaming.

The asbestos deposits are extensively quarried and supply a large percentage of the world's requirements of this product are, perhaps, the most important of the mineral resources of the Province. The alluvial gold deposits have not been productive for several years, yet investigation appears to indicate that there are still opportunities for development. The production of chromite and phosphate has been limited by the availability of more cheaply mined products in other countries. Natural gas has been found in the vicinity of Three Rivers. The limestone and igneous rocks of the Province furnish almost inexhaustible cement building resources, as well as ornamental stone and materials of construction generally. Provincial clays are extensively employed in the manufacture of sewer pipe, brick, etc. Phosphorus has been manufactured in electric furnaces at Buckingham, and occasionally ferro-alloys such as ferro-phosphorous and ferro-chrome. Aluminum is manufactured at Shawinigan Falls from imported bauxite ores.

Production of Silver by Provinces, 1887-1916.

PROVINCE OF ONTARIO

Ontario has the distinction of possessing not only the greatest variety of mineral products, but also of delivering the biggest annual output of all the provinces of the Dominion. Some idea of the extent and variety of her resources may be gathered from the following detail:—Lead, nickel oxide, cobalt oxide, cobalt residues and mixed oxides, copper, gold, pig iron from domestic ore, nickel silver, zinc ore, actinolite, arsenious oxide, corundum, feldspar, fluorspar, graphite, gypsum, mica, mineral water, natural gas, peat, petroleum, pyrites, quartz, salt, talc, cement, clay products, lime, sand-lime brick, stone, etc., are available in greater or lesser quantity.

The principal metalliferous ores are the nickel-copper deposits of the Sudbury district; the silver-cobalt-nickel arsenides of the Cobalt and surrounding areas; the goldfields of Eastern Ontario and of Porcupine; numerous other widely scattered areas in the northern and western sections; the iron ores of Hastings and Frontenac Counties, of Moose Mountain, north of Sudbury, of Michipicoten south-west of Sault Ste. Marie, of Atikokan, west of Port Arthur, in addition to numerous undeveloped deposits throughout the northern and western parts of the province.

both shores of Lake Superior was apparently known to the Indians in very remote days, as evidenced by ancient workings. The attention of Europeans was not, however, drawn to the matter until about the year 1767, when a trader named Henry, who had passed the winter on Michipicoten Island, reported the existence of lead at Mamianse, and of gray ore of copper, there and at various other places. Three years later a company was organized in England to work mines in the Lake Superior district, but the vein on which mining was undertaken narrowed to four inches after sinking had been carried down some 30 feet, and discouraged by this circumstance the work was abandoned.

No further effort in the direction of copper mining in Canadian territory was made until 1845, when a company was organized in Montreal to explore for minerals on the north shore of Lake Superior. Two parties, numbering in all eighty or ninety persons, were sent out, and the coast from Sault Ste. Marie to Pigeon River, a distance of approximately 500 miles was surveyed, and 18 tracts or mineral locations—each 10 square miles—were taken up; their subsequent development, however, proved productively disappointing. Some 21 years later, the celebrated Silver Islet silver vein was discovered within the limits of one of these tracts. In 1847, the company above referred to purchased from the discoverers the Bruce Mines locations, and during the next three years expended a large sum of money in developing and equipping the property; but no profits were realized until 1853 when a small dividend was paid. Unprofitable operations were continued until 1865, and again at intermittent periods under different managements.

Several other mines were worked in the earlier years of Canada's industrial development, but the only discovery of special historic interest was that of the Wallace Mine in 1846, near the mouth of Whitefish River on the north shore of Lake Huron. This was notable since it was the first recorded discovery of nickel in the province, although not apparently occurring in sufficient quantity to justify extensive exploration. Ten years later, nickel and copper ores were discovered six miles north of Whitefish Lake and less than half a mile distant from what is now the main pit of the Creighton Mine; probably the most important deposit of nickeliferous pyrrhotite in the world. No developments, however, were undertaken until several years later, when the district became readily accessible by the construction in 1884 of the Canadian Pacific Railway. Within ten years from that date, all the present important productive mines were located. The ores were first mined for their copper content alone in 1886, production in that year amounting to 3,307 tons, valued at $16,404; but in 1887 the output decreased to 567 tons.

Annual Production of Nickel.

(a) Calculated from shipments made by rail.

Nickel Resources

The discovery of the presence of nickel in the ores of the district is claimed by Robert R. Hedley, who was engaged at the time as assayer for the Orford Copper Co., and as a direct result, a plant was shortly afterwards installed by the Canadian Copper Co. for the production of copper and nickel matte. In October, 1888, Francis L. Sperry, chemist for the latter concern, found that the ores from the Vermilion Mine contained an arsenide of platinum, which was subsequently named sperrylite in honor of its discoverer. The Canadian Copper Co. was organized in January, 1886, with a capital of $2,000,000 to operate the Copper Cliff, Stobie, and Evans mines. The first blast furnace was blown in at the close of 1888, and in the autumn of 1889, a second blast furnace was in operation. The Creighton Mine which was destined to become later the main source of the company's ore supply, was not opened until the year 1900.

In 1902 the International Co. was organized in New Jersey, U.S.A., to consolidate and control the nickel production of the world, the various concerns, the Copper Co., the Orford Copper Co., the Anglo-American Iron Co., and the Mermilion Mining Co., constituting the merger. Since then, operations have been conducted on an increasingly important and comprehensive scale. Among other important resources development relating to the Sudbury district may be mentioned those of the Victoria Mines of the Mond Nickel Co. which are operated independently of the International Co. Nickel production on a limited scale has been secured from the silver-cobalt mines of the Cobalt district. While the nickel-copper mines of the Sudbury district are the chief source of the copper production in Ontario, a considerable tonnage of copper ores is obtained from the copper mines on the north shore of Lake Huron, the copper from which averages fully 4 per cent.

The nickel deposits of the Sudbury district are probably the most important of the known sources of nickel, and supply an increasingly large portion of the world's requirements. The ore reserves are known to be enormous, and nickel production is going up by leaps and bounds, the total for the year 1916 being in round figures $83,000,000 pounds, as compared with something like 50,000,000 pounds three or four years ago. Not only copper, but small amounts of gold, silver, platinum, and palladium constitute valuable by-products.

Annual Production of Gypsum.

Calendar Year	Tons	Value

1914	516,880	1,156,207
1915	474,815	854,929
1916	341,618	730,831

The nickel-copper ore, derived from nine separates mines in the Sudbury district, supplemented by a small tonnage of similar ores from the Alexo Mine in Timiskaming is reduced in smelters and converters at Copper Cliff, and Coniston to a Bessemer matte containing from 77 to 82 per cent. of the combined metals and is shipped in that form to Great Britain and the United States for refining, the product of the Canadian Copper Co. going to New Jersey, and that of the Mond Nickel Co. to Wales. A refinery is now under construction at Port Colborne, Ont., by the International Nickel Co., in which a portion at least of the matte produced by the Canadian Copper Co. will be refined. The British American Nickel Corporation has been actively engaged during the past year in the development of its nickel properties in the Sudbury district and in the erection of a smelter.

Silver Production

Towards the close of the eighteenth century, silver was understood to have been located by a Russian explorer just across the Canadian border near Sault Ste. Marie, but the first discovery of importance on the north shore of Lake Superior was not made until 1866, when the Thunder Bay Mine was staked off. Several other silver mines were worked during the next three or four years, but the silver yield was at best inconsiderable until 1870, when an American syndicate acquired a mining tract of 107,000 acres, in which was included the famous Silver Islet Mine. The purchase price was $225,000, and the sellers were the Montreal company already referred to in connection with the mining of copper. Before operations were suspended on the Silver Islet property, in 1884, ore to the value of $3,089,157 had been extract-

ed, the general average value being something just under $1,500 per ton, although a number of shipments yielded as high as $7,000 per ton. At other mines in the vicinity, rich but limited shoots of ore were worked for a period, while other discoveries were made from 1882 onward. Production steadily declined, however, the output value falling in 1903 to $8,949.

In the autumn of 1903, the first discoveries of the phenomenally rich silver-cobalt-nickel ores of the Cobalt area were made, being, so to speak, an immediate result of the installation of the Timiskaming & Northern Ontario Railway in that region. As a consequence, we find the production of silver increasing in the Province from 17,777 fine ounces in 1903 to 2,451,356 fine ounces in 1905, and reaching a maximum of 30,540,754 fine ounces in 1911. The maximum value $17,772,352 was reached in 1912. The 1916 silver output of the province amounted to 21,975,942 ounces valued at $14,429,623, or 85.6 per cent. of the whole production of the Dominion.

It is of importance to note that the production from the ores of Cobalt and adjoining silver camps account for 21,885,057 ounces of the 1916 total.

Gold Production

As in the production of silver, so with gold, the province of Ontario occupies premier place in the whole Dominion, having done so since 1914. Although gold had been found in a number of different localities, and gave early promise of becoming an important industry, it has only been since 1913 that anything approaching the nature of the latter has been realized. In that year the gold production of the province exceeded the total of all the other years since 1886, only to be doubled itself in turn by the production for 1916, which amounted to 489,679 fine ounces valued at $10,122,563. The Porcupine district, has, since its development, been the main producer. Other producing territories are those of Kirkland Lake and Munro Township in the Timiskaming district, and Long Lake near Sudbury in the Algoma district. The remarkable increase of the last four years has been brought about by the successful development of the Porcupine district and of course more recently still by the extension of milling facilities in that camp. To the 1916 output, the Hollinger Consolidated Mines contributed about 48 per cent., and the Dome about 21 per cent.

Copper Production

The Ontario production of copper comes principally from the nickel-copper ores of the Sudbury district and from the Alexo Mine in Timiskaming, supplemented by a small recovery from the Cobalt district silver ores and by shipments made from six copper properties under development. The total production in 1916 was 44,997,035 pounds, being an increase of 12½ per cent. over the previous year.

Iron Ore and Miscellaneous

Although a number of locations of iron ore have been determined in the province, some expressive of very extensive ore bodies, actual mining has been carried on in but few instances. Mining operations are largely confined to the Helen and Magpie Mines of the Algoma Steel Corporation in the Michipicoten district. The total shipments in 1916 were 339,600 short tons valued at $814,004, as compared with 398,112 tons valued at $774,427 shipped in 1915.

Such of the mineral resources of the province as have been already featured have been dealt with at greater or lesser length because of their meantime special commercial and manufacturing importance, and also because of the fact that in quite recent years specially marked activity has been in evidence relative to them. Regarding the mineral wealth of the province generally, it may be said that same in a variety form is well distributed. In the eastern portions are to be found important deposits of corundum, feldspar, fluorspar, graphite, mica, phosphate, pyrites, talc, lead and zinc ores, etc.; while in the southern section, including a highly developed agricultural area, are found deposits of petroleum, natural gas, gypsum, and salt; this area also contains numerous stone quarries, lime kilns, clay and cement plants. In one very essential resource, that of coal, either anthracite or bituminous, Ontario is absolutely lacking so far as known up to the present.

Blast furnaces for the reduction of iron ore are installed at Hamilton, Deseronto, Port Colborne, Midland, Parry Sound, Sault Ste. Marie, and Port Arthur, while metallurgical plants for the reduction of nickel, copper, silver, or lead ores, are to be found at Copper Cliff, Coniston, North Bay, Orillia, Thorold, Kingston, Deloro, etc.; electric furnaces for the production of ferro-alloys are located at Welland and Sault Ste. Marie. For the encouragement of metal refining, a small bounty is offered for the production of refined nickel, nickel oxide, cobalt, cobalt oxide, copper sulphate, and on white arsenic from mispickel ores, under the conditions and regulations provided in the "Metal Bounty Refining Act."

(a) Includes 7,424 tons shipped late in 1908.

PROVINCE OF MANITOBA

Outside of clay and quarry products, gypsum is the only mineral being mined in the province of Manitoba, although the occurrence of gold has been noted, and gold claims have been exploited on the south-eastern border of the adjoining Ontario boundary and in an area immediately east of Lake Winnipeg. Salt was for many years produced in small quantities from brine near Lake Winnipegosis. There is also a lignite coalfield of considerable extent near the southern boundary of the province, but mining operations have not been conducted thereon. Gypsum is quarried near Lake St. Martin, north of Lake Winnipeg, and is calcined in mills in Winnipeg. Portland cement is made in the latter from local clays and limestone is obtained about 130 miles further north. A natural Portland cement is also made at Babcock. Clay products, chiefly building brick, are manufactured in numerous localities. Limestone is quarried for building stone, and the manufacture of lime is carried on at Stonewall, Stony Mountain, Tyndall, etc.

PROVINCE OF SASKATCHEWAN

The provinces of Manitoba, Saskatchewan and Alberta embrace an enormous area of comparatively level land, and are essentially agricultural territory. Each, however, is underlain by important coal areas, consisting of lignites in the two former, changing to bituminous and semi-anthracite as the "Rockies"

are approached. The raw materials for the manufacture of brick, tile, and cement are found in fair quantity in Saskatchewan, while limestones and building stones also occur. Lignite coal is mined in the southern part or the province at Estevan, Roche Percée, Pinto, Bienfait, and the Dirt Hills district. Coal has also been reported near Wood Mountain in the Eagle Hills, and on the Saskatchewan River near Swift Current. Brick clays are widely utilized, and to the south of Moose Jaw a refractory clay is found which has been employed in the manufacture of fire brick. The sands and gravels of the province are largely used for concrete work of all kinds. Natural gas has not yet been obtained in commercial quantities but there is expectation that it will shortly be found. In the northern part of the province in the Beaver Lake district some gold has been located.

The coal deposits of Saskatchewan furnish coal of the lignite variety only, and as some of the physical characteristics of same in its raw state tend to prevent its successful and economic use, the production of recent years shows but a slight increase, in no way comparable to the increase of population of the province, and the consequent increased demand for fuel for heating and power purposes. The importance of devising better methods for the utilization of the lignite has prompted both the government and the province fuel testing division of the mines branch, Ottawa, to undertake investigation of Western lignites. The production for the year 1916 amounted to 280,835 tons of a value of $442,136, the increase in each case being of a substantial nature as compared with the immediately preceding years.

PROVINCE OF ALBERTA

The mineral resources of the province of Alberta being actively exploited include coal, natural gas, alluvial gold, clay and quarry products. Petroleum has been tapped although small in amount, and, notwithstanding the "oil fever" which was rampant in the province about three years ago, little progress has been made towards making any of the then discoveries real paying propositions. The oil is of light character, with a varying specific gravity. It grades from light green in color to colorless and has a paraffin base. Some of the product has been used in the crude state to run gasoline tractors.

The production of coal has increased very rapidly during the past few years which leads to the belief that Alberta will in the near future be the largest coal producer of all the provinces of the Dominion. Natural gas has been found over a wide area, while in the north there is an enormous tract of tar sands, the commercial value of which has perhaps not as yet been fully determined. Salt and gypsum are also understood to have been located.

Lignite, bituminous, and anthracite coal are each produced in the province, bituminous comprising over 50 per cent. of the output, lignite between 40 and 45 per cent., and anthracite less than 5 per cent. of the grand total. In 1912 Alberta became the second largest coal-

producing Province, a position which it still holds. The output for 1916, the highest in its history, amounted to 4,563,020 of a total value of $11,496,106. It is of interest to note that the Province abounds with small operators, and because of so many new ones entering the field each year, the Department of Mines at Ottawa state that it is exceedingly hard to keep track of all of them. In 1915, there were 39 companies reporting a production in excess of 10,000 tons, their aggregate making nearly 93 per cent. of the total of the province. Eight of these reported an output of over 100,000 tons each, the largest operator being the Canadian Pacific Railway with a total of 541,567 tons from Bankhead and Lethbridge.

NORTHWEST TERRITORIES

The Northwest Territories as at present constituted include all that northern portion of Canada above the 60th parallel of latitude, extending from Hudson Bay on the east to the Yukon district on the west, and including all the northern Arctic Islands that belong to Canada. It is practically unpopulated, except for a few Indians and fur traders. Little is known of the country beyond what has been learned from a few explorations of some of the principal rivers. The occurrence of coal in the Mackenzie River Basin and of native copper in the Coppermine River district have been known for a long time.

Alluvial gold has been found in many of the streams, while the occurrence of iron ores, mica, graphite, salt, and gypsum have been noted. The northern part of this continent and the great Arctic Archipelago further north still contain large areas of the older rocks in which metalliferous and other minerals will no doubt eventually be developed, but in regard to which little is yet known. The area embraced by the Northwest Territories amounts to 1,242,224 square miles, and the population according to the 1911 Census totalled 17,196.

PROVINCE OF BRITISH COLUMBIA

The history of the mining industry of British Columbia is largely that of two well-defined periods—the era of pick and shovel mining, 1858 to 1878; and the era of machinery mining 1887 up to the present time. The first period opened with the Fraser River gold rush in 1858, and closed after the discovery of the Cassiar placers in 1874, and their subsequent exhaustion about the year 1878. This was an era of placer gold mining activity. While authorities vary in their estimates as to numbers, it may perhaps be within the mark to say that between April and June, 1858, some 20,000 persons embarked from San Francisco bound for the Fraser River diggings. The majority soon became disillusioned and disheartened, however. A million dollars represented the yield from the Cassiar field during the first year of operation, this being equivalent to over 50 per cent. of the aggregate production of the country.

Thenceforward, individually directed placer gold mining gradually declined,

Annual Production of Graphite.

hydraulicing on a comparatively large scale being employed instead. In 1898 due to the discovery of gold-bearing gravels in what became known as the Atlin Lake Mining Division, individually directed placer mining again became active. In a short time, however, the majority of the claims were absorbed by syndicates and corporations, with the inevitable result that hydraulicing and dredging became the rule as it had done in the case of the Cassiar.

The second and more important period of mining activity dates from about the year 1887 and, as already remarked, it constitutes the machinery era. In July, 1890, all the more important mines of the Rossland camp, including Le Roi, War Eagle, and Centre Star, were located, and the following year witnessed the discovery of the extraordinarily rich silver-lead mines of the Slocan. Thenceforward, prospecting was vigorously prosecuted throughout the central and southern sections of the Province, the whole of which has proved to be more or less richly mineralised. Silver and lead were the first minerals to be marketed. The first production of copper was made in 1888-1889 from the Hall Mines near Nelson, a consignment of 100 tons of ore showing from 220.5 ounces of silver and 17 per cent. of copper, to 574 ounces of silver and 43.36 per cent. of copper per ton. Regular production did not actually commence until 1894.

Coal Mining Takes Precedence

Chronologically, coal mining takes precedence of all established enterprises on Canada's Pacific Coast, and is to-day, perhaps in point of tonnage, output and value, the most important of the mining industries of the Province. Coal was first discovered by servants of the old Hudson Bay Co. in 1835, but no developments of consequence took place until 1857 when the extensive coal measures at Nanaimo, Vancouver Island, where opened. The development of the coal mining industry proper, however, belongs to the second well-defined period of the history of the Province, since its rapid growth and expansion in the last 35 years is very largely due to the demands created by the new conditions arising from the development of metal mining. The newest and largest productive coal areas have been discovered during this period. The Crows' Nest Pass field was not exploited until 1897, and since then numerous other coal areas have been uncovered. The coal, generally, is bituminous and of excellent quality for domestic or steam raising purposes.

For many years, British Columbia was the premier mining Province of Canada, and was only displaced so far as output was concerned in 1907, when Ontario forged ahead. In a certain sense, our Pacific Coast Province is still of first importance owing to the fact that mining is probably its most important industry. The Province embraces a series of mountain ranges beginning at the "Rockies" which form the eastern border, and extend to the Pacific Coast. Coal and metalliferous ores including gold, silver, copper, lead, and zinc, together with clays, building stone, and gypsum, constitute the chief mineral resources. Antimony, platinum, and molybdenum, and mercury are also found.

With the exception of the placer gold mining of the Caribou and Atlin districts, active productive mining operations are confined principally to the extreme southern portion of the Province and to the districts on Vancouver Island and on the coast. Excluding placer gold, practically the entire mineral production has been obtained from that portion of the Province lying within 100 miles of the southern boundary, or within the area provided with transportation facilities.

Chief Centres of Activity

Among the chief centres of activity are included the coal mines of the Crows' Nest Pass in Eastern Kootenay which produce over 50 per cent. of the provincial coal output. Silver-lead and zinc ores have been extensively mined at Marysville, Moyie, Ainsworth, Slocan, Sendon, Silverton, and other points in East and West Kootenay, while to the south at Nelson and Rossland gold and copper are the principal values in the

ores mined. At Sheep Creek in the Nelson division is an important gold camp in which the ores are mainly free milling. Further west in the area known as the Boundary District, low grade copper ores carrying gold and silver values have been found in very large deposits from which the annual production has ranged between one and two million tons. At Hedley there is located perhaps the most important gold mine in the Province. On the coast, copper ores are mined at Britannia Bay, Texada Island, and at Granby Bay or Anyox.

Vancouver Island possesses the oldest and most important coal mines as well as important metalliferous deposits. The Hazelton district has in recent years come to the front as a mineral centre. Prospecting and development is being undertaken at many points on or near the coast, while due to the construction of the Grand Trunk Pacific Railway access has been provided to hitherto untapped mineral territory. Important smelting industries have been established at Trail, Grand Forks, and Greenwood, in the southern interior, the fuel for which is provided by the coal mines of the Crows' Nest, or of Alberta. A new copper smelting plant started operation at Anyox in March, 1914.

Since the latter year, and arising from the necessity that we should supply to the fullest extent possible the metal requirements of our intensive munitions industry, additional smelting and refining plants have been in process of establishment and are being now gradually developed into front rank producers. With a view, however, to a better grasp being had of the capacity provision now available for treating the various ores recovered, a detail embracing all Canada follows a little further on.

YUKON TERRITORY

The Yukon Territory, which geographically is a continuation of the Rocky Mountain range extending north-westerly from the 60th degree of Latitude; the northern boundary of British Columbia to the 141st Meridian; and the Alaska boundary, became famous on account of the Klondike gold fields located in the vicinity of Dawson on the Yukon River. Placer gold is still the principal mineral product, although there is an interesting output of copper and silver ores, and of coal, the district possessing important areas of the latter. Gold ores and ores of copper, silver, lead, and antimony, have been found widely distributed, and without doubt, the region possesses enormous mining possibilities.

The first reference to the occurrence of gold in the Yukon appears in a book published in London in 1869, the author, F. Whymper, cursorily mentioning the discovery by Hudson Bay Co. men of minute specks of gold, and adding "but not in quantity to warrant a rush to the locality." In 1878, a prospector named Holt made a journey to Teshintoo and reported having found coarse gold, but his statements were not confirmed by miners who afterwards prospected the locality. It was not until 1881 that the first discovery of paying placers was made by a party of four miners who ascended the Big Salmon River for about 200 miles, and found gold along its course and in the river bars.

During the next few years exploration of other sections of the territory were undertaken, and gold was found on Fortymile Creek on the upper part of the Lewes River, and on the Upper Pelly. In 1887, some 250 miners were engaged in working claims or prospecting in the Upper Yukon. It was not until 1894, however, that the Klondike district was discovered by the finding of gold in Quartz Creek, while a year later, discoveries were made on Goldbottom, a tributary of Hunker Creek; in 1896, the phenomenal richness of Bonanza Creek was made known.

This discovery was followed by the historic excitement of 1897-1898, when a stream of adventurers from all parts of the world flowed into the territory. In 1900 the production of gold amounted in value to $22,000,000. From that year, however, it has gradually declined, the latest available returns, those for 1916, showing a value of $4,391,669 only. The goldfields are included in an area of about 800 square miles, bounded by the Yukon River on the west, the Klondike River on the north, by Flat Creek, a tributary of the Klondike River, and Dominion Creek, a tributary of the Indian River, on the east, and by the Indian River on the south.

In addition to the gold output noted above for the year 1916, there were produced 360,466 ounces of silver valued at $236,686, and approximately 3,980,640 pounds of copper.

CANADA'S FUTURE MINERAL PRODUCTION

From what has preceded, it will have become apparent that in the last quarter century, if not throughout the full fifty and a half years of Confederation, quite marked progress has been made in the uncovering of Canada's mineral resources, and while it goes without saying that development will grow in intensity and be supplemented by even greater and richer discoveries as the years come and go, there must be neither hesitancy nor indifference shown as to the primary disposition of the various products. Powerful influences are now at work with the idea of ensuring that to the utmost limit mineral matter recovered shall be reduced and converted into marketable commodities by factories of one kind or another within our own borders and while, during these three war years, achievement towards the end indicated has been highly creditable, its good effect will be entirely lost were we to cease to maintain and strengthen deter-

minedly so vital a requirement of our national well-being.

Canada's Metallurgical Works

It is the writer's opinion that mining and manufacture have not gone hand in hand as they should, in the past, and that as a result, both have suffered in progress and development. The outlook is for a greatly improved condition in this respect, and is traceable to the single-purpose idea of boosting Canadian industry. In order to familiarize readers with the chief manufacturing resources of the Dominion which are allied with mines and minerals, the most recently compiled and authoritative detail is appended.

Upper Ottawa Conservation. — The water-power interests have been greatly benefited by the conservation dams completed in 1915 on the Upper Ottawa to regulate the flow of that river. The resrvoirs can supply an additional flow of 10,000 cu. ft. per second, thus increasing the total power possibilities between Mattawa and Carillon by some 400,000 h.p., while at Ottawa alone, where the water is being fully utilized, the increase is approximately 30,000 h.p.

The Canada Metal Co. Ltd.: Its Development and Product

Staff Article

A feature of the numerous references frequently made regarding Canada's natural resources is the fact that non-ferrous metals constitute a more valuable portion of the total than is generally realized. The indispensability of the more familiar metals—lead, zinc, copper, etc.—has been brought home to us in a convincing manner this war time, thereby imparting a unique importance to such firms as operate in these and kindred metals.

THE extent to which engineering and iron and steel industries have been called upon to aid the cause of liberty has been so great and spectacular, that the degree to which the non-ferrous metal industry has contributed to the cause is not nearly so fully realized. The over shadowing of the soft metals by the hard is not altogether unexpected, but the indispensability of lead, antimony, aluminum, copper and zinc, to say nothing of tungsten, molybdenum, chrome, etc., will be evident to the casual reader when due consideration is given to the requirements of the war,—lead and antimony for bullets, aluminum for engine and aeroplane parts, copper for driving bands, and along with zinc for the numberless items of brass,—these alone indicate slightly the extent of the non-ferrous metal industry and impart more than passing interest to the plant and products of the Canada Metal Co., Toronto, Ont.

Consistent Growth

This firm occupies a prominent place in that category of manufacturing establishments whose growth has been contemporaneous with, and emblematic of the rapid industrial development of the Dominion during the last two decades. Like many other businesses typical of Canada's growth and opportunities, the company represents the life efforts of W. G. Harris, president, assisted by his son Wm. G. Harris, junior, vice-president; their operations commenced on a comparatively small scale, have been attended by a consistent growth and success now represented by branch factories in Montreal, Winnipeg and Vancouver. The range of product includes a great diversity of non-ferrous metals. Babbitt, battery zincs, solder, pig lead, lead pipe, antimony, ingot tin, stereotype and all white metal mixtures and the production of die-castings are but one part of the product. Plumbers' lead pipe fittings, metal bar for art glass work, ventilators, sash bars, etc., occupy a prominent place in the firm's output.

The production of babbitt metal is one of the most widely known of the company's activities and a close acquaintance with their plant and methods is confirmatory of the reputation gained by this product. One of the first things noticed by the visitor is the piles of tin pigs or ingots, especial interest attaching to this metal because the two principal, if not the only sources from which it can be obtained at present, are both in the British Empire. The Straits Settlements, that far eastern dependency of Britain, is the source of the finest and most tin in the world, and the fact that it is obtainable in reasonable quantity at this time is a tribute to Britain's control of the ocean. The other source referred to is in England itself—the ancient tin mines of Cornwall, worked by the Romans, and to-day supplying tin to a British colony, whose extent and potential wealth exceeds any thing the most ambitious Caesar ever dreamed of. And as if to prove that Canada lacks not herself, mounds of lead ingots from British Columbia lie alongside the tin, their birthplaces separated by a third of the globe's circumference, and here united to produce an article of Canadian manufacture which in many diverse applications is helping our forces win the war.

LEADPIPE PRESS FORMING A SINGLE LENGTH OF 12 IN. DIA. PIPE WEIGHING 900 LBS.

Babbitt and Lead Products

The production of babbitt metal is not accompanied by the clatter and rattle and din of shell manufacture nor is there the hustle and bustle of numerous operatives, gaugers and inspectors; instead there are large melting pots reminiscent of soldiers' soup boilers, next them are the various quantities of selected metals, while a silent individual passes to and fro, glancing at pyrometers which indicate the progress of the melt, sampling the products and despatching them to the laboratory for analysis to check his work, and finally when the alloy has reached the stage where the various contents are in proper condition to exert their full individual and collective influences, the metal is ladled out and poured into the metal moulds which give it the familiar form in which it reaches its users. The entire process is characterized by a confident calmness and unobtrusiveness of operation which reflects the confidence of the operator in the guiding influence of the laboratory worker.

And so it is with all of the work throughout the factory. Leaving the refinery with its cauldrons of liquid metal, not white hot and glaring like a steel works, but glittering with a sheen like liquid silver, and noting with interest the three 35-ton melting pots which are the largest of their kind in the British Empire, the visitor passes to the pipe shop, where a battery of six presses form the lead and various alloys into the numerous forms in which they reach the consumer. One of the illustrations shows a lead pipe press in operation. It is operated by hydraulic power, the cylinder which contains the ram extending down into a pit below the floor level. The upper end of the ram projects into the extruding cylinder which has suitably arranged dies on its upper end. This cylinder is filled with molten lead at a suitable heat, which, when subjected to pressure by the ram from below, is forced out through the dies, and

A CAST FROM ONE OF THE 35-TON MELTING POTS WHICH PRODUCE ANTI-FRICTION BEARING METALS.

assumes the desired shape—circular, square, oval or otherwise.

The engraving shows the melting pot next the press, in which the metal is kept at the required temperature. As shown, the press has just extruded a single piece of lead pipe having a diameter of 12 in. and a weight of almost 900 lbs. In the case of small pipe and rod, the product is guided as it leaves the dies and is wound around reels which form it up into the coils in which it is marketed. Machines of this type produce the miles of lead wire and solder which are annually consumed in all branches of manufacture.

Sheet Rolling

Equally interesting are the rolls in which thick slabs of lead are gradually squeezed down to the various thicknesses required in commerce. A slab of lead, say 30 in. by 18 in. by 3 in. thick is cast in the refinery and after analyses and grading, in placed on the table of the rolling mill. This table is fitted with numerous rollers similar to a steel mill, which enables the slab of meta to be moved back and forth easily. The slab is brought up against the rolls which are adjusted to a height somewhat less than the thickness of the slab. A slight pressure causes the revolving rolls to bite and the metal is drawn in and reduced in thickness as it passes through. The table extends a considerable distance on each side of the rolls so as to accommodate the increased length of the metal as it is gradually reduced from the slab to sheet form. At the far end of the top roll, shown in one of the illustrations, can be seen an operator feeding down the top roll to the required thickness of the finished sheet the amount of each reduction being dependent on the power of the mill and the grade of metal being worked, pure lead with a high degree of ductility being capable of much heavier reductions than other grades whose composition is varied for specific reasons.

From this department the sheet lead may either go to the shipping department or, if intended for final reduction to very fine thicknesses, it is taken to the finishing rolls, where such specialized products as tea lead and so forth are made. Here the rolls are of comparatively small size and very highly polished. They are fitted with wiping mops which remove any foreign particles from their surface and prevent damage to the thin high finished sheets which are so familiar in the form of tea packages, and linings for sheets. Needless to say, the high ductility demanded in lead for this purpose is easily obtained by the refining and controlling methods employed by the company.

The sheet and pipe forms of lead absorb a considerable portion of the output of this metal, but with characteristic progressiveness the firm has found other forms in which to market its product. Die casting, with its everincreasing applications has been successfully undertaken, and castings of any required white metal alloy are now produced in considerable quantity. The manufacture of hollow metal bars in various metals for use in art glass work, sash bar sections, and ventilator materials are allied lines, while further activities include the manufacture of special brass nails for aeroplane construction, and copper nails for shipbuilding requirements, the raw material for which is conveniently produced in the plant.

Subsidiary Developments

The valuable trade connections formed through the manufacture of plumbers' lead fittings gradually paved the way for the handling of bath room fixtures, tubs, lavatories, etc., and an extensive business in this line has developed in late years. A special department is devoted to the making of stone laundry tubs for domestic use, and the complete manufacture of these articles is done on the premises. Carefully selected materials, properly constructed moulds, and a closely controlled method of tempering or seasoning insure a finished article having perfect uniformity of quality, and reliability of construction.

ROLLING MILL DEPARTMENT WHERE LEAD INGOTS ARE ROLLED OUT INTO SHEETS.

Two departments, not previously referred to in detail, contribute largely to the success of the company's efforts. These are the tool room and the laboratory. The former is necessary in order to build the various machines and devices which have been developed through years of concentrated effort and singleness of purpose. The latter is equally as necessary to check the product in various stages and devise new mixtures and alloys and assist in supplying material exact to customers' specifications. Each is equipped with the best and most suitable tools and equipment. Machines and tools for the rapid and accurate production of dies, or the building of special mechanism, are installed, and skilled labor familiar through long usage with the peculiar requirements of metal working apparatus is employed throughout. The laboratory, of which a view is reproduced, contains many delicate instruments, scales, furnaces, testing machines and reagents to enable the chemist to feel the pulse of the work at all stages, direct the efforts of the various departments intelligently and accurately, and at all times maintain the quality of the product up to specification. By such methods, equipment, plant and employees the Canada Metal Co. has gradually, rapidly and safely developed a highly specialized line of manuture which has stood the country in good, yet silent stead through these critical times, and which will doubtless prove of equally as great avail in the future.

OVERSEAS CORRESPONDENCE

IN a recent report, Harrison Watson, Canadian Trade Commissioner, London, writes as follows:—

"It is clear that owing to lack of means of ocean transportation, United Kingdom import restrictions, and the increasing Government control over the importation and distribution of supplies of all kinds, actual transactions in most lines of Canadian exports are practically impossible at the present time. Upon the other hand, it is a favourable time for propaganda work.

"Owing to complete trade dislocation resulting from the war, it is necessary to seek new sources of supply of most articles and this important subject is now receiving attention from both public bodies and business firms. As, in addition, there is a very strong desire to obtain these supplies from within the British Empire, and indeed to increase inter-Imperial trade relations of all kinds, Canadian producers, manufacturers, and shippers should be urged to take the fullest advantage of the opportunity.

W. G. HARRIS,
President, Canada Metal Co.

"While it is apparent that under present circumstances the work of the Trade Commissioner service in Great Britain must necessarily be mainly confined to spreading a better knowledge of Canada's resources with a view to trade after the war—and this is even more the case in the provinces than in London—the Trade Commissioners, aware of the keen desire of Canada to increase and develop export trade, inform inquirers that Canadian shippers propose making every effor to increase their export trade, and while it is obvious that actual business is impossible at the present time they urge United Kingdom importers in the meantime to initiate correspopndence with Canadian houses, so that information can be supplied and arrangements negotiated which will make definite transactions possible when the war ends.

"For this reason Canadian exporters are urged to make a special effort to reply a little more fully to letters of inquiry addressed to them by potential customers in this country, as a means of getting hold of connections which should be valuable later on, this more particularly as it is so frequently brought to the notice of Trade Commissioners that firms in all parts of this country who have been supplied with the addresses of Canadian houses are greatly disappointed at the results of letters which they write to Canada and the meagre information supplied, in comparison with the response which they receive from other countries to which similar inquiries have been addressed.

Should Anticipate Future Business

"Although persons who are fully aware of the situation which has been existing in Canada for some time past, whereby the complete energy of manufacturers, shippers, and producers has been directed to furnishing war material and supplies for the Allies, will appreciate that Canadian business houses have had little time to attend to anything else, the majority of firms in this country are unaware of this position, and attribute delay, and even failure, to reply to letters to a lack of interest and cordiality. It is obvious that a prompter and fuller response to applications for information would materially assist the efforts of the Trade Commissioners in this country to attract attention to Canada's great resources and trade possibilities."

A CORNER OF THE LABORATORY, SHOWING BALANCES, TESTING MACHINES AND CHEMICAL APPARATUS.

B.C. BUILT SCHOONERS REPORTED SOLD

OFFICIAL announcement is being held in abeyance, but it is reported that the Canada West Coast Navigation Co. has disposed of at least nine of its twelve auxiliary schooners to the Societie Francaise Generals, which acted for the French Government in the transaction. It is said that more than a million dollars profit was made in the deal.

Several of the vessels involved in the reported deal are at sea. The Margaret Haney, first unit of the fleet launched in Victoria, is now trading off the coast of India, having made a quick voyage to Bombay on its initial charter. The Laurel Whalen, the Esquimalt, and the Malahat, are all away on their maiden voyages. The Jean Steadman and the Beatrice Castle are still tied up in the upper harbor awaiting the arrival of Bolinder engines. The Esquimalt and Beatrice Castle have been sold by the Canada West Coast Navigation Co. to other interests since completion.

NEW HIGH CANADIAN TRADE RECORD

EXPORTS of Canadian produce in November were valued at $187,315,515 and the excess of exports over imports amounted to $114,607,076, making new high records for any month in the history of the Dominion. The best previous showing was that of July last, when exports were about 177 millions, and the excess of exports over imports about 87 millions.

The spectacular exhibit for November was due to a heavy outward movement of both grain and manufactures. Exports under the head of agricultural produce reached a total of nearly 78 millions, the highest ever reported for any month. The total of manufactures record, but still high at nearly 68 mil- was considerably below the previous lions. There was some expansion, too, in the minor classifications, chiefly animals and their produce.

Contraction of Imports

The notable increase in the country's favorable balance for the month was partly due to a contraction in imports, which were the smallest of any month since February. If the recent contraction stood for any important economy in Canadian buying of luxuries in foreign markets, the decline would be encouraging. Possibly economy was some factor, but more probably it is due very largely to the new difficulties of Canadian manufacturers in securing raw materials in the United States. If that is the case, some decline in the volume of exports of manufactures must be looked for in due course, with adverse effect on the general trade figures.

Year's Results Impressive

The trade results for the current year become more and more impressive as the year draws to a close. For the eleven months to November 30, exports total $1,399,018,936 and the excess of exports over imports to $455,519,369, the latter comparing with $262,957,000 for the same period in 1916, $115,980,000 for the same period in 1915. In the same eleven months of 1912 there was a balance against Canada of $281,123,000.

Eleven months' figures to November 30 in each of the calendar years, as taken from the Montreal *Gazette* records, show the following comparisons:

Year.	Exports.	Imports.	Balance.
1917 ...	$1,399,018,000	$943,499,567	+$455,519,369
1916 ...	961,666,000	698,709,000	+ 262,957,000
1915 ...	521,953,000	405,973,000	+ 115,980,000
1914 ...	342,098,000	450,922,000	— 108,824,000
1913 ...	380,410,000	614,057,000	— 233,647,000
1912 ...	303,320,000	584,443,000	— 281,123,000

+Excess of exports.
—Excess of imports.

As usual, the figures are based on exports of Canadian produce only and imports entered for consumption, with gold exports and imports excluded.

The favorable balance of $114,607,000 for November compares with $36,868,000 in the same month last year. Exports increased nearly 80 per cent. in value, largely no doubt because of increased prices rather than increased volume, while imports were virtually stationary. Comparisons for November since 1912 follow:

Nov.	Exports.	Imports.	Balance.
1917	$187,315,515	$72,708,439	+$114,607,076
1916	109,558,000	72,690,000	+ 36,868,000
1915	92,931,000	45,217,000	+ 47,714,000
1914	42,872,000	31,552,000	+ 11,320,000
1913	57,762,000	50,202,000	+ 7,560,000
1912	43,781,000	59,318,000	— 15,537,000

November Details

As already noted, grain and manufactures were the principal factors in the record-breaking exports for November. In the usual official classification the exports compared with those for November last year and October this year as follows:

	Nov., 1917.	Nov., 1916.	Oct., 1917.
Mine .....$	6,879,290	$ 7,026,024	$ 7,668,525
Fisheries ..	4,315,983	2,600,021	3,744,367
Forest	5,438,570	5,172,272	4,900,739
Animals ..	23,237,442	13,603,193	18,679,265
Agricul. ..	77,961,781	36,789,632	45,504,815
Manuf. ...	68,947,268	44,119,094	74,419,973
Miscell. ...	535,181	248,714	176,060
Total .....$	187,315,515	$109,558,950	$155,093,744

The second half of the year is establishing large gains over the first half, and probably the December return will be but little inferior to the returns for the past few months. Exports and imports by months show:

1917.	Exports.	Imports.	Balance.
Jan. ....$	99,106,259	$ 72,323,074	+$ 26,783,185
Feb.	68,224,383	68,030,469	+ 193,914
March ..	122,415,312	102,335,886	+ 20,079,426
April ...	65,145,449	86,807,809	— 21,662,360
May	149,057,236	107,596,379	+ 41,460,857
June	116,285,841	97,515,067	+ 18,770,774
July	177,366,148	90,181,595	+ 87,184,553
Aug.	146,387,586	91,931,009	+ 54,456,577
Sept. ...	112,621,462	75,893,364	+ 36,728,098
Oct.	155,093,744	78,176,476	+ 76,917,268
Nov.	187,315,515	72,708,439	+ 114,607,076
Total .$	1,399,018,936	$943,499,567	+$455,519,369

STEEL PRODUCED FROM HYDRO-ELECTRIC ENERGY

THE electrical production of such products as fine steel, calcium carbide, carborundum and other substances requiring high heat, is growing, and will undoubtedly utilize an increasing share of the electric energy derived from Ontario's water-power.

The high prices now prevailing for coke and coal and for steel products make the electric furnace very attractive, and there is every indication that electric steel production in Ontario will grow rapidly during the next year or two. It is anticipated that the electric furnace will not only be applied to the production of high-speed tool steels, but that it will also be used to smelt the coarser grades now produced in the open-hearth furnace. There is also every indication that electric smelting of iron, copper and other ores will be an important factor in the mining districts of the province.

The British Forgings, Toronto, has installed ten electric furnaces of a capacity of 6 tons per heat each, or an annual capacity of 72,000 tons. This is the largest electric steel plant in the world, and uses electric energy generated at Niagara Falls. This, therefore, furnishes an additional reason why our water-powers should be kept under public control to ensure powers to industries at the lowest possible cost.

LOW-GRADE FUEL PROBLEMS

THE plants in Canada which use steam to generate electric energy are faced with difficulties owing to the present high prices and poor delivery of the grades of coal which heretofore have been most popular for steam-producing purposes. The problem is not so much to secure the largest number of kilowatt-hours per pound of coal, as to determine the fuel that can be utilized without making too many changes in the existing equipment, and to provide for its continuous delivery. Many other industries besides electric plants could profit by ascertaining the low-grade fuels available for their use, and, if necessary, so modifying their equipment that they could be used.

Many types of low-grade fuel are being successfully burned, such as soft coal with high ash content, bone coal, culm, lignite, coke breeze, anthracite screenings, etc. Before changing to the lower grade of coal, however, each company should first determine the methods whereby they will solve the problem involved in utilizing it. These problems include a reduced steam output from the same grate surface, additional moisture in fuel, clinkers, draft and the fusing of firebrick.

Electric companies now using lower grades of fuel than heretfore find it advantageous to co-operate with the mines in securing a full supply of coal in the summer, when the mines have an ample supply on hand and the railways are in the best position to handle it.

Year's Building in Montreal. — Up to December 19 building permits numbering 1,574 of $4,348,873 value were granted during the year 1917, as against 1,880 permits, value, $5,333,204, in 1916. No great change either way is anticipated in the coming year.

The power house plant, machinery and equipment described in the following article represent a degree of excellence in design and arrangement equalled by few plants elsewhere and possibly excelled by none. In addition to being evidence of the technical skill and ability of the officials concerned with its construction, it further affords convincing evidence of the manner in which reputable power companies realize both their duty to present consumers and the necessity of preparedness for emergencies as well as future developments.

THE tremendous war-created activity in metal working and power using plants throughout Ontario, with its resulting drain upon the electrical resources of the province, has directed so much of the general public's attention to hydro-electric power plants and schemes that comparatively little attention has been given to the scale on which privately-owned systems have been increasing their capacity and strengthening their system generally so as to insure continuity of service under any required circumstances.

Location and Capacity

These circumstances render more than ordinarily interesting the extremely modern and complete steam operated power station which has just been recently completed and put into service by the Dominion Power & Transmission Co., Hamilton, Ont. The plant is situated just outside the eastern limits of the City of Hamilton, and is designed to have an ultimate capacity of 75,000 K.V.A., of which 25,000 has been installed up to the present time. The output is delivered at a voltage of 42,000 to the high tension lines of the company, whose main source of supply is their hydraulic power plant at DeCew Falls, 34 miles distant from Hamilton.

In addition to its generating capacity, the steam plant is designed to act as a stepdown transformer station of 25,000 K.V.A. capacity to transform the high tension current to 13,200 volts for distribution to local factories in the manufacturing district in the near vicinity. Fifty per cent. of this stepdown capacity, i.e., 12,500 K.V.A., has been installed so far.

General Layout

A cross sectional elevation of the entire plant is shown in Fig. 1, and an exterior view of the building from the same viewpoint forms the title illustration. By comparing the location of the principal features a clear idea of the arrangement and disposition of the various equipment, items and departments will be obtained. Fig. 1 is particularly interesting, as the actual arrangement of the plant as shown enables the process of power generation to be followed in strict sequence of operation.

Coal Handling

Commencing at the right, the coal handling plant is shown where the fuel is dumped direct from the cars into the hopper of the coal crusher or placed in auxiliary storage provided in this building, which has 1,250 tons capacity. The coal handling plant, which was supplied by C. O. Bartlett & Snow Co., has a capacity of 60 tons per hour, and includes a feeder, crusher, elevator and weighing larry. The steel-cased double-plunger feeder has a 26 in. by 30 in. opening, the coal being moved by two plungers operated by adjustable eccentrics. It is driven by sprocket and chain drive from crusher countershaft through a clutch, so that it can be cut out at any time and the crusher driven independently.

The feeder discharge is coupled directly to the top of a 2-roll crusher, directly gear-driven by a 25 horse-power Westinghouse motor at 750 revs, per min. Each roll consists of two heavy cast iron spiders supporting six cast steel segments, forming a roll 26 in. dia. by 24 in. long. The roll shafts are 4 7/16 in. dia., one being rigidly supported, while the other is carried on adjustable sliding bearings backed up by heavy coil springs. They are set to deliver coal of 2 in. size and under.

The bucket type elevator is a conspicuous feature in Fig. 1, extending from the crusher below the train tracks up to the bunker between the stacks. It has a length of 138 ft., and is enclosed in a casing 5 ft. high by 9 ft. wide, with ladders on either side. The coal bunker has a capacity of 420 tons, and is pro-

vided with three 18 in. by 18 in. double undercut doors, through which it drops into the weighing larry.

Boiler Room

Interior view of boiler room, Fig. 2, shows the weighing larry in position for supplying fuel to the two nearest boilers. The hopper of the larry has a capacity of 5 tons, and as can be seen in the illustration, is supported on two cross girders like an overhead crane, the rail centres of the overhead track being 21 ft. The hopper scale has a capacity of 10 tons, with reverse reading beam. The gates on the delivery spouts which lead from the hopper to the stokers are controlled from the larry cage, as are also the overhead bunker doors. A 5 horse-power Westinghouse slip-ring polyphase motor is direct geared to the larry trucks for traversing purposes.

FIG. 2. MAIN AISLE OF BOILER ROOM, SH OWING OVERHEAD COAL LARRY WHICH WEIGHS THE FUEL AND DISTRIBUTES THROUGH CHUTES INTO THE STOKER HOPPERS.

Inclined Tube Boilers

Four water tube boilers of the inclined tube type are installed. These are built in single settings, and were supplied by the Edge Moor Iron Co., having an individual capacity of 1,050 horsepower. Each boiler has four drums made of 7/16 in. plate, with an outside diameter of 35⅛ in. and a length of 20 ft. They are constructed of fire box steel, and the longitudinal seams are double butt strapped and triple riveted.

Each boiler has 472 Am. standard soft steel tubes, 4 in. dia. by 20 ft. long, the two lower rows being No. 9 gauge and the balance No. 10. Flanged steel header construction is used, along with oval hand holes and inside covers, which are tightened by boiler pressure, and are independently removable.

Stoker Installation

The mechanical stokers were constructed by the Taylor Stoker Co., and each has 11 retorts, the total width being 19 ft. 6 in. and depth 8 ft. 3½ in. One stoker engine is provided for each pair of stokers, and the same practice is followed with the fan equipment. The fan engines were built by the Harrisburg Foundry & Machine Works, and are of horizontal type. They are located on the ground floor level next the condensers, and are supplied with heated air from the generator cooling system.

The fan wheels are direct connected to the engine crankshafts and are capable of delivering sufficient air to operate all of the stokers at 150 per cent. of their normal rating. The stokers, individually, are capable of firing their respective boilers at a sufficient rate to force them to 235 per cent. normal rating without difficulty. Boiler accessory equipment includes Ashton pop safety valves; Hancock feed water and check valves; Faver blow-off valves; Homestead blow-off cocks; Ashcroft steam gauge and Reliance water column. Automatic soot blowers and the customary instruments to enable the engineers to operate the boilers efficiently are likewise provided. Rolling doors provide convenient access to the tube header and form an attractive front to the boiler.

Foster superheaters are installed on each boiler, under guarantee to raise the temperature of 31,500 lbs. of steam per hour to 538 degs. F. which, at a pressure of 200 lbs. per sq. in. represents a superheat of 150 deg. When operating at 150 per cent. of boiler rating, this degree of superheat would be increased to 160.

Chimney Stacks

Flue gases are distributed to the atmosphere by two chimneys of radial brick construction, erected by Canadian Kellog Co. The stacks are of identical proportions, being 240 ft. high above foundation; 22 ft. 2 in. dia. base; 12 ft. internal top diameter. They are lined to a height of 40 ft. from a point 2 ft. below flue opening. The lightning conductors have 6 copper points, ¾ in. dia. by 8 ft. long with 1½ in. solid platinum tips all connected and grounded in accordance with best modern practice. Accessory equipment includes 4 in. H. and M. draft gauges and connections and 2 in. pyrometer connections.

Water Purification Plant

The make up water for the plant is obtained from Burlington Bay and in order to render it suitable for use is

FIG. 1. SECTIONAL ELEVATION OF POWER STATION. NOTE SYSTEMATIC ARRANGEMENT OF OPERATIONS FROM RECEIPT OF FUEL AT RIGHT TO DELIVERY OF CURRENT TO DISTRIBUTING LINE AT LEFT.

treated by the We-Fu-Go system of water purification. This plant is housed in a separate building at the extreme left of the title illustration, and was installed by Wm. B. Scaife & Sons Co. It is of quite extensive proportions, and amongst principal items are two reaction ft. 4 in. high, equipped with mechanical 4 in. high, equipped with mechanical stirring devices and each requiring 4 hours for treatment of its capacity of water.

Two filter tanks 8 ft. dia. by 5 ft. 4 in. high contain the filter beds of crushed quartz (98 per cent. silica) supported by a layer of washed and graded gravel. The flow of water from the settling tank into the filter tank is regulated by brass-fitted balanced valves with seamless copper floats. Constant alarm bells operated by the floats ring in water softener and boiler rooms. The filter beds are provided with air wash pipes for cleansing purposes, having discharge openings equally distributed over the filter beds and connected to a pressure blower.

The two generating units installed are identical in type and size, being Westinghouse turbo-generators of 10,000 equivalent K.W. capacity, delivering 3-phase current at 6,600 volts; 1,100 amps. per terminal; 66 2-3 cycles. The generators are of the 4 pole type and run at 2,000 revs. per min.

The layout of the plant is such that when future extensions are completed, six turbo-alternator units will be accommodated, each of a maximum rated capacity of 12,500 K.V.A. giving a total station capacity of 75,000 K.V.A. or an equivalent of 60,000 K.W. at a power factor of 80 per cent.

The generator department occupies the central portion of the power house, the three principal parts—boiler room, generator department and switch and transformer rooms being parallel with each other, as shown in Fig. 1. There are three floor levels in the generator department; the lowest one is below ground level and forms the pump well for the condensed circulating pumps; the ground level floor on which are carried the condensers and auxiliary equipment, and on which rest the foundations for the turbo-generators; the main or operating floor on which the generating units are erected, and which is level with the boiler room floor (see Fig. 1). Two views of the main floor are shown in engravings Figs. 3 and 4 while a view of the auxiliary equipment for one unit is shown in Fig. 5. The plan layout of the entire generating equipment is shown in diagram Fig. 6.

Steam Turbines

The design of turbine adopted is that known as the "impulse reaction" type. The turbines are of Westinghouse construction and employ multiple expansion parallel flow.

Steam is admitted through primary admission valves of balanced poppet type enclosed in steam chest. Secondary admission valves, automatically operated by mechanical connection with governor, are arranged to admit steam to lower stage when load exceeds capacity of turbine with steam received through primary valve. The secondary value will also operate in this manner should vacuum or steam pressure fall to a point where the turbine is unable to carry the load normally, returning to its seat when excess capacity is no longer required.

FIG. 4. ONE OF THE 12,500 K.V.A. TURBO-GENERATOR UNITS, SHOWING STEAM ADMISSION VALUES, GOVERNOR GEAR AND THROTTLE VALVE.

An automatic throttle valve, controlled by separate safety governor, is arranged to close before the turbine speed exceeds a safe limit. It can be adjusted for any predetermined speed, and means is provided for tripping by hand from a convenient location.

Blading

The impulse section consists of two rows of moving and one row of stationary blades, the balance of the machine consisting of reaction type blades. The steam passes through the impulse section towards the generator; and then towards the centre of the turbine where it divides and passes toward each end in opposite parallel flows. Nickel iron is the material of which the impulse blades are constructed, and phosphor bronze for the reaction blades.

The main bearings are self-aligning, and lubrication is effected by an oil pump operated from worm gear on turbine shaft, with delivery and return piping between reservoir and bearings, sufficient head being provided to insure ample flooding of bearings.

A speed variation of between 3 and 4 per cent. can be obtained under normal conditions, while a speed changing device is provided with remote control from the operating station.

FIG. 3. MAIN FLOOR OF GENERATOR DEPARTMENT. NOTE EXCITER SET IN FOREGROUND, ALSO EXHAUST AND CIRCULATING WATER PIPES.

Condensing Plant

The circulating pumps in the pump well are turbine-driven centrifugals of the closed impeller type. The location of the pump is such that the intake level is 1 ft. below discharge level, the total pumping head, exclusive of friction head through condenser, being 2 ft. The pumps are gear-driven by Westinghouse impulse turbines through reduction gear of the Westinghouse self-aligning type, having right and left hand helical gears to equalize end thrust. The large gears are carried on solid bearings.

The condensers are located on the ground floor immediately below the turbines. They are of the surface type with two passes, the circulating water entering at the bottom and leaving at the top while the steam enters at the top. In the foreground of Fig. 3, can be seen the circulating discharge pipe going down at an angle, also an angle pattern of atmospheric relief valve with discharge pipe passing through wall into boiler room.

The effective cooling surface, measured on the outside of the condenser tubes is 15,000 sq. ft. there being in each condensor 3,040 tubes of 1 in. outside dia. by No. 20 gauge, active length of tubes being 18 ft. 10 in. Both tubes and tube plates are of muntz metal, the plates having a thickness of 1¼ in.

Condenser capacity is such that 13,800 gals. of water per minute will maintain a vacuum of 28 in. (referred to 30 in. barometer) when handling 143,000 lbs. of condensed steam per hour with injection water at a temperature of 68 deg. F.

Hot Well

Individual hot wells are provided for each condenser, the accessory equipment assembled in each group (see Fig. 5) including air pump, condensate pump, feed water heater and boiler feed pump.

FIG. 6. PLAN LAYOUT OF BOILERS AND AUXILIARY EQUIPMENT.

The air and condensate pumps are mounted on a common shaft and are directly driven by a Westinghouse impulse turbine running at 2,500 revs. per min. The air pump is a Westinghouse-Leblanc rotary with solid bronze runner, and a capacity of 12-2-10 cu. ft. per sec. The condensate pump is centrifugal.

These pumps with the turbine are placed between the Cochrane open type feed water heater and the foundation wall of main turbine, see Fig. 5, the foreground on the illustration being the grating which covers the circulatting pump well. The circulating water pipe from the pump to the condenser can be seen at the left hand bottom corner where it passes through the foundation wall to the condenser.

Behind the feed water heater can be seen the boiler feed pumps and also the fan engine previously referred to.

FIG. 5. AUXILIARY EQUIPMENT IN HOT WELL. AIR AND CONDENSATE PUMPS ARE AT LEFT OF FEED WATER HEATER, AND BOILER FEED PUMP BEYOND.

Boiler Feed Pumps

The boiler feed pumps are of the direct turbine driven centrifugal type. A Westinghouse horizontal impulse turbine running at 2,500 revolutions per minute drives a multistage centrifugal pump of the horizontal volute type with double suction, having 3 stages and a capacity of 525 U. S. gals. per min. The total head operated against, including pipe friction is 520 ft., and water up to 210 deg. F. can be handled. The horse-power of turbine at 200 lbs. per sq. in. is 125.

Generator Details

The general appearance of the generators will be gathered from views of main floor Figs. 3 and 4. They are of the revolving field type, with 4 poles, direct connected to the turbine shaft, and having removable end bells to allow access to windings. The field coils are wound with copper strap in slots cut in field core and the insulating material is capable of withstanding a temperature of 150 deg. C. without injury.

The armature core is built of laminated steel in cast iron frame and held firmly in place between two end plates. The armature winding is insulated with material with 90 deg. C. safe limit of temperature rise.

The windings and core are cooled by forced draught generated by two sets of fan blades attached to the rotor shaft which draw air from the air conditioning plant and force it towards the centre from both ends, whence it is expelled outward in a radial direction through air ducts into the passages which give the characteristic external appearance to generators of this type. The warm air is then returned to the conditioning plant where it is cleaned, cooled, and delivered to the intake passages of the generators again.

Air treating plant was installed by the Carrier Air Conditioning Co, and consists of 2 No. 263 F humidifiers with the necessary tanks, sprays, eliminators, pumps, piping and nozzles. Each has a normal capacity of 78,000 cu. ft. per min., with overload of 109,000 cu. ft.

The eliminators consist of vertical galvanized iron plates spaced uniformly in rows, and with parallel surfaces bent to a small angle so that a series of continuous sinuous passages are provided through which the air must pass. The first four corrugations of eliminator plates act as washing surface and are closely spaced so that air passing through is broken up in small thin layers, causing all particles of dust to come in contact with the wet surfaces. The air then enters the spray chamber in which are 560 spray nozzles which maintain a finely atomized spray against the direction of the flow of air. These spray nozzles are placed 3 ft. in front of the final eliminator plates which are provided with an independent set of flooding nozzles which maintain a constant sheet of water flowing down the wet surfaces and allow the spray nozzles to be shut off entirely in very humid weather and the washing procured through flooded eliminators only.

FIG. 7. INTERIOR OF CONTROL GALLERY AND OPERATING ROOM. BEHIND THE INSTRUMENT BOARD AT THE LEFT IS A LARGE BAY WINDOW GIVING UNOBSTRUCTED VIEW OF MAIN FLOOR (SEE FIG. 3.).

The casing for each humidifier which contains the foreging apparatus is 10 ft. long, 13 ft. 8 in. wide, and 13 ft. 1½ in. high. Each unit has a marine light inside, with external switch, and a 15 horse-power motor is provided for operating the centrifugal pump which supplies the water to the nozzles.

Exciters

Westinghouse motor generator exciter set is provided for, each generator being a 75 K.W. 125 volt, shunt interpole generator, driven by a 112 horse-power, 550 volt, 3 phase induction motor. motor.

Power for the exciters is taken from the 6,000 volt station service bus, through a bank of 6600/550 volt step down transformers, each exciter having its individual transformers and switching equipment, with circuit connections as shown in the schematic diagram Fig. 9.

As a precaution to ensure continuity of service, a spare exciter, driven by a steam impulse turbine, is available, which may be quickly connected to any machine in case of necessity. This is effected by tieing in on the 125 volt d.c. field bus, opening the field switch which connects the machine to the exciter and closing the field switch which connects its with the field bus. The two field switches are remote controlled circuit breakers mounted on a panel which also supports the motor operated contactor for inserting or cutting out resistance in the generator field, the rheostat for this purpose being located behind the panel.

The switch for tieing in the spare unit on the field bus is located on a panel in the operating room which panel also carries the switches for the 50 ton capacity service crane in the engine room. The other half of the same panel controls all circuits supplied by the storage battery, including direct current motors, control equipment, auxiliary d.c. lighting circuits, etc., a tie switch enabling the two sections of the panel bus to be tied together as shown in Fig. 9.

Transformers

Each generator is connected to a bank of three, single phase transformers which step up the voltage from 6600 to 42,000 volts. The machine together with the transformer constitutes a unit and these units are electrically connected only on the 42,000 volt bus, thus introducing two banks of transformers between machines to serve as buffers to the short circuit current, in the event of trouble in one. No special reactance coils are used in the system.

There are at present two banks of step up transformers installed in the power house in a room adjoining the high tension switch room, and separated from it by a brick wall. As shown in Fig. 8, partition walls form pockets to separate each bank of three, single phase, 4,000 k.v.a., 41,000/6,600 volt, oil insulated, water cooled, Westinghouse transformers representing a capacity of 12,500 k.v.a. per bank. They are delta connected on both the high tension and low tension sides.

The conductors from the high tension terminals are of ¾-in. copper tubing and are carried on wall and ceiling insulators through the wall insulator bushings to the 42,000 volt bus bar.

Openings are left in the side walls of the pockets for a passage aisle in front of the row of transformers. A car track runs along this aisle and should it be required to remove a transformer

FIG. 8. TRANSFORMER EQUIPMENT. NOTE POCKET ARRANGEMENT OF ROOMS, ALSO WHEEL-MOUNTED BASE PLATES, WHICH FACILITATE REMOVAL OF INDIVIDUAL TRANSFORMERS IN CASE OF MISHAP.

for inspection or repair all that it is necessary to do is to cut the transformer out of the circuit, disconnect the unions on the oil and water pipes and roll the transformer, whose base is mounted on wheels, on the truck. It may then be removed out under the 10 ton capacity hoist in the inspection room at the end of the row, which is separated from the transformer room by a rolling steel door. The remaining two transformers in the bank would then constitute an open delta connection for carrying the load.

Step Down Feeder Transformers

In addition to its generating capacity, the station is designed to act as a step down transformer station for distributing power to the surriunding manufacturing district. The ultimate capacity of the plant devoted to this service will be, when completed, 25,000 k.v.a., but at the time of writing, equipment for a capacity of 12,500 k.v.a. is installed and one 13,200 volt feeder line leaves the station to supply power to the nearby plant of the National Steel Car Co.

The transformation is effected through a bank of three 42,000/13,200 transformers, identical in design and rating to those in the generator circuits. They occupy the last pocket at the North end of the system and are connected on the high tension side through disconnecting switches and a G. A. type circuit breaker to the 42.000 volt bus. The low tension 13,000 volt bus is at the north end of the 6,600 volt bus structure Fig. 12, as also are the switching apparatus, choke coils, and lightning arresters for the feeders. The feeder lines leave the building at this point through the roof and are carried across the roof to the outgoing pole line. The cells containing the aluminum cell lightning arresters are provided with asbestos doors and the choke coils are helices of aluminum rod.

FIG. 9. DIAGRAM OF STATION WIRING SHOWING SWITCHES.

FIG. 10. INTERIOR OF SWITCH ROOM, SHOWING OIL SWITCHES AND BUSES FOR 42,000-VOLT CURRENT.

Low Tension Bus Arrangement

The 6,600 volt bus bar and switching room is divided into upper and lower compartments which contain the necessary switching and auxiliary equipment for supplying alternating current to exciter motors and station light and power service at a lower voltage than 6,600 volts. The low tension distributing, station service, transformers with disconnecting switches, shunt, and current transformers, are installed in a concrete structure in the lower compartment, Fig. 12, and on the floor above are 3 pole, oil circuit breakers shown in Fig .11 for the generators and supply circuits.

The current from the generators is carried to the controlling breakers by 1,250,000 c.m. lead covered cables.

Two station service switches, electrically interlocked, serve to energize the light and power transformers from either side of the system as desired. The controller operates the trip coil of one switch and at the same time energizes the closing coil of the other switch but the closing current cannot flow until the first switch is open, thus the closing of the switch does not commence until the other switch is open.

Control

The operating room shown in Fig. 7 is on the second floor, open to unobstructed daylight on the three sides and with a large bay commanding a view of the turbine room from the fourth side. Here the operator electrically controls the 6,600 volt generator circuits, the 42,000 volt oil switches on the transformers and transmission lines and the oil switches on the 13,000 volt feeders from the bench board.

The main switchboard faces the bay window overlooking the turbine room and is of the benchboard type with dummy buses with the indicating instruments mounted on pedestals in front of the benchboard. All oil switches are equipped with a telltale lamp system, indicating the "open" and "closed" position of the switches on the benchboard in the operating room, by small telephone lamps.

Directly behind the operator are mounted the totalizing panels which show by indicating and graphic recording meters, the total amount of power supplied by each unit to the outgoing lines. A feature of these panels is the row of test connections at the

base of the panels which facilitates inserting a test meter in any circuit desired, should the board meter be damaged or as a check on its accuracy.

The proximity of the panel to the stairway which leads to the room, warranted the enclosing of the rear of this panel by a structure, which gives it a more sightly appearance and at the same time allows of easy access for inspection.

The operating room is sufficiently large to accommodate the necessary control apparatus for the completed installation. The entire number of benchboard sections are in place and it only remains to drill and wire the board as further units are added. Another panel, not shown in Fig. 11 contains the tie switches for the direct current auxiliaries previously mentioned and this is mechanically operated.

FIG. 11. VIEW IN 6,600-VOLT SWITCH ROOM, SHOWING RANGE OF ENCLOSED SWITCHES.

Safety Measures

Reference to Fig. 9 will afford an idea of the ample safety protective devices employed, both for protecting the apparatus and for ensuring safety for the operating force when engaged in examining or repairing any part of the system. Every piece of apparatus may be segregated by means of disconnecting switches, one on each side of every oil switch, and when these are opened the wiring above and around the oil switch is dead and the oil switch can be inspected, and dismantled without danger. The outgoing lines are protected against lightning and static surges by electrolytic arresters. Another detail involving the safety of the operators and the proper operation of the station is the locking of the 13,000 volt disconnecting switches. Where the ordinary knife switch may open up by reason of the magnetic repulsion when carrying heavy loads, thus often seriously damaging adjacent apparatus by the intense heat of the arc, the lock type switch here employed in the feeder lines ensures a positive connection under heavy currents.

Auxiliary Equipment

In a separate room on the ground floor is located the storage battery reserve for supplying direct current to the control, crane service, and other circuits in case of an interruption of the main circuit. This battery consists of 66 cells, has a normal voltage of 125 volts, and a normal discharge rate of 200 amp for one hour.

The 50 ton power house crane is manufactured by Cleveland Crane and Engineering Co. and is the cage operated type. It is provided with mechanical brakes of the double friction, band type, self lubricating and running in oil. A solenoid operated electric brake is also connected to the armature shaft of the hoist motor and connected so as to apply itself in failure of current. It is equally effective in stopping motor in hoisting or lowering and is capable of sustaining the full load of the hoist. Each hoist is provided with Auto circuit breakers, which break the circuit when the hook is raised above or descends below a predetermined point.

A 10 ton capacity, hand operated hoist is provided in the inspection room on the transformer floor. In this room are also the oil tanks for the transformer oil, consisting of two tanks, one for clean, and one for dirty oil. Two small oil tanks for the oil switches and lightning arresters are mounted above the transformer oil tanks. Electro-Seal insulating oil is used.

The transformers and high tension oil switches are provided with sewer connections and provision is made so that in case of an explosion in the tank or a fire, the oil can escape to the sewers.

Two pumps form part of the equipment for handling the oil. One delivers oil from the tanks, up to the transformers and a centrifugal pump operates the small filter press output for filtering and drying the oil.

Transmission Lines

The two 42,000 volt transmission lines leaving the station are carried on one set of steel towers and deliver their output to the high tension out-door switching station at Bartonville, there to be linked in parallel with the long distance transmission lines from the hydraulic station at DeCew Falls.

In order to join the two stations together it is necessary to synchronize the two and therefore synchronizing equipment is provided in the control room. The signalling devices are an aid to the operator when bringing an incoming machine up to synchronism, as by means of it he may inform the turbine attendants, on the floor below, what is desired of them. The various

FIG. 12. ONE SIDE OF THE 6,600-VOLT BUS STRUCTURE LOCATED DIRECTLY BELOW SWITCH ROOM SHOWN IN FIG. 11.

orders are illuminated on the signal board, provided for each machine, by pressing an electric button. The attendant then executes the order and presses the corresponding button on his board, signifying to the operator that the order is carried out. When it is desired to call the attention of an attendant to any particular machine, a Klaxon horn is sounded and a lamp lights up over the machine intended.

It is quite interesting to note that the power station at DeCew Falls can feed back on the 42,000 volt bus in the steam station and cause the generators to operate as synchronous motors, when the turbines are throttled and just sufficient steam admitted to circulate through the turbine blades and keep them from becoming excessively hot through friction effect. This is a particularly valuable feature in this case, for until demand on the station necessitates every unit carrying a power load, those machines not generating may be put to economic use as synchronous condensers for regulating the power factor of the load, thus maintaining the required voltage at the receiving end of the hydraulic line from DeCew Falls under a wide range of load.

From the operating standpoint, this system is very advantageous, as it admits of regulation at the Hamilton end of the line, the generator field being overexcited to increase the power factor and decrease the voltage drop in the lines on heavy loads and underexcited to decrease the power factor and increase the voltage drop on light loads. The improvemnt in regulation thus effected will enable the lines from DeCew Falls to carry more power than before and incidentally show an immediate profitable return on the capital which has been expended, to provide for future power demands.

The power house is built entirely of brick and steel with reinforced concrete floors and is as fireproof as far as any station can be. The inside walls of the engine room are faced with white enamel brick up to the crane level, above which, the walls are satin brick and the ceiling a buff gypsum. The floor is laid with English red quarry tiles and conforms with the general interior finish of the power house to give it a neat and bright appearance. The steel throughout, and most of the cement floor surface, is painted gray.

Every convenience is provided for the operating staff, the equipment including adequate office accommodation for the superintendent, locker room and wash room for the employes, well equipped repair shop and intercommunicating and local telephone system. Excellent lighting is provided throughout, all the larger rooms being very effectively illuminated by properly contained nitrogen lamps suspended from the roof trusses. The plant has been in operation since June 1917, and was designed and built by the following members of the Co.'s organization: W. C. Hawkins, chief engineer and managing director: Geo. Service, mechanical engineer; Chas. H. Hutton, electrical engineer, to whom we are indebted for the illustrations and data accompanying the article.

MAILS BY AIR AROUND WORLD

ADDRESSING a large asembly of members of the Canadian Club at luncheon recently in Toronto, Lord Montague impressed upon his hearers the present and future importance of aviation. In the early days of the war many people had undertestimated the value of aircraft—the airplane and seaplane—in modern warfare. There was no doubt any longer as to the possibilities of the aircraft.

Lord Montagu predicted that the time was not far distant when airplanes would be used to carry the mails around the world. Lord Montague stated that he was a member of a committee in London which has under consideration a scheme for the establishment of an Imperial aircraft service when the roar of guns in the war zone ceases. He believes that all the colonies of the British Empire should be linked up in the scheme.

"Commercially the airplane will play a wonderful part in the developmen of business life of Canada after the war," said Lord Montagu. "Toronto has now become the aviation centre of the North American continent, and after the war the aviation factories and schools of instruction should be continued. They will be necessary. The Germans may be our superior in some respects in the matter of building machines, but they cannot beat us in the quality of the men. Canadian aviators have demonstrated to the Germans that they are constituted in make-up and fighting qualities of the right kind of stuff. Generals who watched them have told me that as fighters at a high altitude they are remarkable for courage, ingenuity and skill."

Eyes of the Army

Referring to the invaluable service rendered by the airplane and seaplane in the present struggle in Europe, Lord Montagu declared that the Generals are kept in close touch with what is going on behind the lines of the enemy. The Allied aviators had demonstrated their superiority over the Germans in this respect and could rightfully lay claim to the title, "Masters of the air." What the Allied armies lacked in man-power was more than made up in the invaluable branch of the army. Lord Montagu impressed upon upon his hearers the fact that with the exception of the United States there was a lack of man-power in the army of every Allied power fighting in Flanders. Consequently every month as the war goes on brings more vididly to the minds of the people the relative importance of the airplane and seaplane.

An Army of Pilots

In conclusion Lord Montagu made a special plea for co-operation in the matter of striving to keep the aviation service and schools of instruction in Toronto and elsewhere at a very high standard of efficiency. He said there were between 1,500 and 2,000 Canadian pilots at the front, while an additional 500 were in Toronto preparing to go to the front.

COAL MINING LEASES

COAL-MINING rights on Dominion lands are disposed of by the Dominion Government under leases, the provisions of which are so liberal as to afford the operator every encouragement. They do not, however, give any consideration to the relation of the coal seams, the order in which they should be worked to prevent waste, the quality of the coal in the several seams and the coal content in the leased areas. The result is that a tremendous tonnage of coal is wasted.

All other important coal-mining countries which dispose of coal-mining rights under a system of leasehold have found it necessary to prevent waste arising from the lessee sacrificing the public wealth for his private gain and waste due to injudicious mining. In Nova Scotia, Austria, Australia and Japan, and in the case of privately-owned coal lands in England, Scotland, and in certain portions of the United States, before a lease is granted or mining operations are begun, it is necessary for the applicant or the holder of a mining right to submit a scheme of intended operations to the proper authorities. To receive approval, this proposed method of mining must be such as to prevent wasteful mining, and, at the same time, provide for the safety of the miners. That the Dominion Government should take measures to prevent the waste under the present system of leasing needs no demonstration.

CANADA'S NICKEL REFINING CAPACITY

IT was pointed out at the first annual meeting of the Commision of Conservation in 1910 that, although Canada was possessed of the richest portion of the world's supply of nickel, we were deriving only a comparatively small amount of benefit from it. The most expensive portion of the work of recovering nickel from the raw ore was done in other countries. This anomaly is now in course of being remedied. As the result of constant agitation and discussion we are likely to see by far the greater part of the work done in Canada.

The British American Nickel Corporation has under construction near Sudbury a new electrically-operated smelting refinery which will have a capacity of 2,500 tons of ore daily and a nickel production of 20,000,000 pounds per annum. The smelter will produce a matte carrying 80 per cent. copper and nickel, which will receive final treatment in the refinery.

The International Nickel Co. is constructing a new refinery at Port Colborne at a cost of $4,000,000, which will be in operation in a few months. The initial capacity will be 15,000,000 pounds of nickel per annum, but it can be expanded in a few years to produce 60,000,000 pounds. The new plant, according to the company, will be able to supply the needs of the whole British Empire.

Review of the Past Year's Iron, Steel, and Metal Markets

Staff Article

The year 1917 has been the most prosperous in the history of the iron and steel trade in Canada, surpassing the immediately previous best twelve months both in regard to tonnage output and price. The most confirmed optimist would hardly have anticipated such developments as have taken place during the year. The war has, of course, been responsible for the increased activity through its enormous demand for steel for munitions and ship construction, and indications point to a continuance of this activity during 1918.

IN a general survey of the iron and steel situation in Canada, it is necessary to consider conditions in the United States as the two markets are so closely allied, particularly owing to the fact that this year the latter entered the war on the side of the Allies. The participation of the United States in the war changed considerably the aspect of the situation when their interests became common with the Allies. Association between the steel trade in the States and Canada became closer, to the mutual benefit of both countries. Very important developments have taken place in the States and considerable space must be devoted to these features as they have had an important effect upon the situation in Canada. Among these developments were the fixing of maximum prices of iron and steel products, and the embargo placed on the export of the latter. Another feature has been the steady advance in prices.

Improvement in the physical condition of Canadian steel plants has taken place during the year. In the time of bad trade there was a disposition to spend as little money as possible on repairs and improvements except when absolutely necessary. This condition has been to a large extent corrected, the cost being paid for out of earnings. The improvements have thus been made without increasing capital charges. During the past three years, important extensions have been made at all the steel plants and output has been considerably increased. These plant extensions have also for the most part been paid for out of earnings. This is an important feature to consider for not only have the plants been improved physically and made more efficient, but the capacities have been increased and earning power is consequently greater. All this has been achieved without increasing capital charges.

Operating Conditions

Operating conditions have not been entirely satisfactory this year. There has been a scarcity of suitable labor for one thing, while some concerns have been handicapped by a shortage of raw materials. For the first three months the mills in Ontario were handicapped through not being able to get full coke supplies on account of the freight congestion on the railways. This trouble eventually was eliminated but the mills got behind on their orders. The mills in Nova Scotia have not been troubled on this account as they have their own coke ovens. A shortage of coal has also affected operations.

During the summer, little complaint was heard regarding shortage of raw materials, but in the fall an acute situation developed in the coke market in the States which adversely affected Canadian consumers. The shortage of coke resulted in a number of blast furnaces being banked in the States which threatened to curtail the output of steel. The freight congestion on the American railways was the principal cause of the trouble although scarcity of labor at the mines and also at the ovens had something to do with it. The severe weather which set in during the early part of December further handicapped the railroads and also operations at the ovens. Drastic measures to relieve the situation are inevitable before conditions can become anything like normal.

Steel Production

The table which is given elsewhere in this issue, compiled by the Mines Branch of the Department of Mines, Ottawa, shows that there was an increase in output of both pig iron and steel during the first nine months of this year over the corresponding period of 1916. The figures also show the imports of iron and steel which are particularly interesting in view of the embargo on these materials from the United States.

The total production of steel ingots and direct castings during the first nine months was 1,265,183 short tons, as against 911,054 tons during the first nine months of 1916. The average monthly production during the first nine months of 1917 was 140,576 tons as against an average monthly production throughout 1916 of 106,268 tons.

The production of steel in electric furnaces, included above, was 30,960 tons during the first nine months of 1917. The production of steel in electric furnaces in September was over 5,000 tons or at the rate of over 60,000 tons per annum.

Electric Furnace Feature

The electric furnace is becoming more popular in steel plants, particularly where electric power is cheap, and constitutes perhaps the most interesting development of the iron and steel trade in recent years. Improvements in design are continually being made with a view to increased efficiency.

An electric furnace installation of considerable size was placed in operation in Toronto this summer. The units installed in Canada so far are mostly of the Heroult type. There are electric furnaces in operation at Toronto, Welland, Montreal, Collingwood, Belleville, Orillia. An electric furnace installation is contemplated at Port Moody, B.C., while there is also a small unit in Toronto producing steel from ore fines and flue dust.

Pig Iron Production

The table compiled by the Mines Branch, Department of Mines, Ottawa, gives the complete returns of the pig iron production for the first nine months of this year and also for 1916. These figures also show an increase in pig iron production for the above mentioned period. The total production of pig iron during the first nine months of the present year was 895,307 short tons as against 844,717 short tons during the first nine months of 1916. The average monthly production throughout 1916 was 97,438 tons, whereas in 1917 the average was about 99,478 tons, representing a slight increase which may be considered satisfactory in view of the difficulty that was experienced in the first three months of the year in obtaining coke, etc., owing to the tie up on the railways, which affected principally the furnaces in Ontario. The exports of pig iron, short tons, in 1916, averaged 1,942 tons monthly and for nine months of 1917 the average was 1,135. In contrast with this decrease, imports increased, the monthly average in 1916 being 4.919 tons and over nine months of the current year it was 5,982 tons.

Furnaces were in blast at Sydney and North Sydney, N.S.; Hamilton, Port Colborne, Sault Ste. Marie, and Deseronto, Ont. Small quantities of pig iron were also produced in electric furnaces from scrap steel at Orillia, Collingwood, St. Catharines, Toronto, and at Montreal. The total quantity of pig iron thus produced in electric furnaces during the nine months was 9,983 short tons.

Prices of pig iron have been increasing steadily all the year and a record has been made; the highest price being $60 per ton. The heavy demand is partly the reason for this, with the furnaces for several months behind on deliveries. The most important producer of foundry iron for the open market has been the furnace at Port Colborne, Ont., the others having been for the most part making pig iron for the steel works. On this account there has been a shortage of

foundry iron, which still exists. The high cost of coke has been an important factor in the pig iron situation and has been largely responsible for the continued advances. The fixing of pig iron prices in the States has not affected the Canadian market to any great extent and the opinion is held in the trade that prices of domestic iron will not decline much further for some time, partly on account of the embargo and also because of the sold-up condition of the furnaces.

Production Has Increased

The extraordinary demand for steel for munitions was the principal reason for the great activity in the steel industry during the past two years or more. The urgency of the demand made it necessary to increase production and the steel concerns in Canada without exception responded to the call and extended their plants. A large percentage of these extensions was completed last year, therefore the producing capacity of steel has been higher in the past twelve months, which accounts for the increases shown in the tables. Further plant improvements are under way at the mills so that the producing capacity may be said to be still increasing. There is little doubt that full advantage will be taken of this situation and continued prosperity seems assured for the steel companies while the war lasts.

In view of the shortage of steel and increasing demand, Canadian mills will

CAUSE AND EFFECT

A steady stream of coolant, permitting greater efficiency from your equipment, and thus eliminating unnecessary grinding of the cutting tool, is the logical effect of the installation of

TRAHERN
ROTARY GEARED PUMPS

on your metal working machines. We positively guarantee that our pumps will deliver all the coolant that can be forced through the discharge opening, at a speed varying from 300 to 500 R.P.M. according to the size of the pumps used. A centrifugal pump delivering the same sized stream of lubricant must operate at a speed of at least 1,000 R.P.M. This excessive rate of speed necessarily results in a short lived pump.

These are but a few of the many interesting points pertaining to TRAHERN pumps. Write for particulars.

CISCO

The Lathe with the Pull
The Lathe of Simplified Accuracy

Every feature, every part, every line of CISCO Lathes tells the same story.

A Lathe designed for simplicity of operation, a Lathe built of the best material, best workmanship and with careful care.

A Machine that a boy can operate, yet doing all that a man could wish.

A Lathe in which the proportions are so carefully studied that there is no waste material, no waste of energy or effort.

A Machine that is as near perfect accuracy as it is possible to construct out of cast iron (.0005 in 18").

A Lathe which, on account of its construction, requires few, if any, repairs. Use it half decently and it will never wear out.

A Machine which has more power than any other lathe of the same size built. It pulls like a bull.

be able to participate in conjunction with those in the United States. While it is true that munitions orders have been considerably reduced in Canada, there is still a comparatively large tonnage going into shell. An outlet for the tonnage not required for shell in Canada will be found, so the decline in munitions orders should not result in decreased output. The Dominion Government has arranged credits for munitions to cover the manufacture of 6-inch, 4.5-inch, and shrapnel, which will keep the firms engaged upon their production employed until next May. As a result, a considerable amount of business for the steel mills is assured for at least the first quarter of 1918.

As the placing of further shell contracts depends upon the ability of the Dominion Government to finance them, it is unlikely that this industry will be as active in the future as it has been in the past. A strenuous effort will be made by the Government to raise funds, but as foodstuffs and other war supplies have also to be financed only a percentage of the total amount can be expended on munitions. This question has a direct bearing on the steel business which will benefit to a greater or less degree according to the sum set apart for the purpose. However, as already intimated, the surplus of steel not required for shell will doubtless be used in the manufacture of other products, such as rails, bars, shapes, wire and wire products, bolts, rivets, etc.

A considerable export business has grown up since the war started, and Canadian steel products of various kinds are now being shipped to different parts of the world. This export business would doubtless have attained bigger dimensions but for the shortage of ocean tonnage. However, orders have come from unexpected quarters and the result so far must be gratifying to the concerns engaged in it. How long it will last is uncertain, but the experience gained and connections made will be helpful after the war.

Unfortunately this development received a setback when the Dominion Government placed an embargo on the exportation of steel products except when destined for Great Britain or British Possessions. It is not unlikely that the embargo will be extended to include British Possessions on account of the acute shortage of steel which developed during the latter part of the year.

High Prices Prevailed

The high prices of steel which have prevailed throughout the year have been beneficial to the mills, while recent developments, in the form of an embargo, have also been favorable to them. Although operating costs have gone up, steel prices have advanced more in proportion and the mills have got the benefit. For the past three or four months there has been much excitement in the steel industry over the question of prices, which has been debated from every angle. For some weeks prior to the announcement of fixed prices at Washington it was predicted that there would be a general recession of values and there was very little private buying, except to fill urgent needs, in anticipation of lower prices. The steel market was very unsettled and although prices on the more important steel products have been fixed it cannot be said that the situation is much easier. The much discussed one-price-for-all policy was eventually adopt-

PRICE FLUCTUATIONS PER 100 FEET OF 3½-INCH SEAMLESS AND LAPWELDED BOILER TUBES DURING 1914-1915-1916-1917.

ed, thus putting the U. S. Government, the Allies, and domestic consumers all on the same buying basis.

That was all right as far as the U. S. was concerned, but it eventually transpired that steel for Canadian consumption was not affected by this policy. In other words Canadian consumers have had to pay on such steel as they imported from the States prices which were current before the agreed-upon prices were announced. How long this situation will continue is difficult to say as the mills in the U. S. have so much Government business on hand, and also in view of the fact that private consumers have considerable difficulty in getting material.

Steel and Iron

Although in comparatively few instances have there been any price recessions, and these have been entirely on imported material, it may be that when the mills have worked off the greater part of their unfilled tonnage booked at the high prices they may feel more inclined to accept business on the Government schedule. There is, however, the question of supply and demand to be taken into consideration, which will probably tend to stiffen prices in spite of Government regulations. The above remarks apply for the most part to conditions across the line, but have to be considered as conditions there affect steel products imported into Canada such as plates, sheets, billets, etc.

Take boiler plates as an instance. At the beginning of this year, ¼ to ½ in. plates were quoted at 5c per lb. Before July was over the price had more than doubled, being 12c, eventually reaching 13c. In November the price on plates in the States was fixed at 3¼c, but the price on the Canadian market for this material is now 12c per lb. Steel bars early in the year were quoted at 3¾c, eventually advancing to 5½c, which price still rules in spite of the fact that the fixed price in the States for this material is $2.90 per cwt. or a shade under 3c per lb.

The lighter gauges of black sheets and galvanized sheets are the only materials that have declined to an appreciable extent; No. 28 gauge black being now $8.50 whereas the top price was $11 per cwt. Boiler tubes advanced steadily until early in the fall when the crest was reached; they have been stationary since. Wrought pipe advanced steadily until early in July, but has been stationary ever since. Billets, open-hearth and Bessemer were quoted in Pittsburgh at $55 a ton in January. They eventually advanced to $100 a ton, reaching that point in June when forging billets were $125 a ton. This was the high water mark. Prices began to decline when the fixed-price schedule was announced, and they gradually worked down to the lower level that obtained early in the year. Bessemer and open hearth billets are now $47.50, and forging billets $60 a ton.

These figures cover the more important steel products and serve to show the peculiar situation that has prevailed during the year, and still exists. The outlook in regard to prices is decidedly obscure and it is impossible to say what will develop except that indications point to their continuance on a high level owing to the big demand for steel, and the unusual conditions prevailing in the market on both sides of the line.

Steel Prices As Fixed

It may be of interest at this juncture to quote the steel prices fixed by the War Industries Board at Washington. These prices serve to indicate what may be the trend in the future although they have not yet materially affected the situation in Canada. The agreed-upon prices are as follows and are subject to revision January 1, 1918. Iron ore, basis lower lake ports, price agreed upon $5.05 gross ton, no change. Coke, Connellsville, price agreed upon $6 net ton, recent price $16 a ton, a reduction of 62.5 per cent. Steel plates, basis Chicago and Pittsburgh, price agreed upon $3.25 per cwt., recent price $11 per cwt., a reduction of 70.5 per cent. Pig iron, price agreed upon $33 gross ton; recent price $58 gross ton, a reduction of 43.1 per cent. Steel bars, Pittsburgh and Chicago basis, price agreed upon $2.90 per cwt., recent price, $5.50 per cwt., a reduction of 47.3 per cent. Steel shapes, basis Chicago and Pittsburgh, price agreed upon $3 per cwt., recent price $6 per cwt., a reduction of 50 per cent.

Shortly after the above prices were given out, a further list was issued by the Board which includes the following.—Those with Pittsburgh as base are: Steel bars (3 to 5 in.), $3.25 per 100 lbs.; steel bars (5 to 8 in.), $3.50; steel bars (8 to 10 in.), $3.75; steel bars, (over 10 inch), $4; skelp (grooved), $2.90; skelp (universal), $3.15; (sheared), $3.25. Blooms and billets, 4 by 4 in. and larger are now $47.50 gross ton; billets under 4 by 4 in. are $57; slabs $50; wire rods and sheet bars, $57, Pittsburgh and Youngstown bases. The prices will apply to private as well as to Government contracts.

The price of billets, fixed at $47.50, represents a reduction from the current

PRICE FLUCTUATIONS OF 2-INCH LAPWELDED WROUGHT IRON PIPE DURING 1914-1915-1916-1917.

GEOMETRIC DIE-HEADS

HERE'S a quartet of die heads that means death to threading trouble. They are worthy representatives of the Geometric family — among which can be found a Self-Opening Die Head or Collapsing Tap for any thread you could possibly want.

These tools can be adapted to any make of turret lathe or screw machine. Many manufacturers already make them standard equipment. We are convinced that the rest will, eventually; any Geometric user will tell you why.

THE GEOMETRIC TOOL COMPANY
NEW HAVEN CONNECTICUT

Canadian Agents: Williams & Wilson, Limited, Montreal; The A. R. Williams Machinery Co., Limited, Toronto, Winnipeg and St. John, N.B.

market price of about $22.50 a ton; billets at $51, a reduction of from $29 to $44 a ton, and wire rods fixed at $57 a reduction of $33 a ton. Soon after the above schedule was issued, prices were fixed on a large number of other steel products and pig iron differentials were also settled. All these prices come up for revision early in January but from what can be heard it is unlikely that there will be any important changes.

PRICE FLUCTUATIONS OF GALVANIZED (PREMIER) AND BLACK SHEETS (28-GAUGE) DURING 1914-1915-1916-1917.

Embargo Situation

Owing to the necessity of conserving the supply of steel for war purposes, the United States Government, a few months ago, prohibited the export of steel except under license. Not only have prices been regulated by the Government, but the entire output of the mills will be supervised by the Priority Board, who will see that the U. S. Government and Allies have all the steel that is required for war purposes, and then allot what is left for commercial purposes.

In view of the large tonnage required for war purposes it will be a difficult matter to meet the demands of the ordinary consumer to the full extent of his requirements. This being the case, it is unlikely that the embargo placed on steel exports from the States will be modified to a greater extent than has already been done, although some leniency may be shown in the interpretation of the clause for war purposes or contributory thereto. In any event, consumers not working on war contracts are bound to suffer and manufacturing operations will be restricted. This is the most serious feature of the whole situation for those concerns using material such as can only be obtained from the States. Manufacturers who use domestic material will not be inconvenienced, except perhaps by some delay in deliveries, which can be overcome by judicious purchasing.

It is understood that the fixed prices do not apply on export business. This may be so for the time being, as the mills are not booking orders at the new prices, because they have no steel to deliver except on high-priced contracts. All new contracts will, of course, be subject to investigation by the Priority Board. The embargo also tends to neutralize the effect of the agreed-upon prices, and at the present time there is no indication of a general recession in the latter.

The embargo does not affect steel required for war contracts, shipbuilding and railroad betterment or equipment, and, therefore, will only be a hardship for consumers not working on war orders. This feature, however, is sufficiently serious to affect the general public, as a shortage of many articles made of iron and steel for every-day purposes will likely ensue. The embargo cannot help but restrict manufacturing operations in many plants, but nothing can be done to materially improve the situation as war work must not be held back.

It would appear that the embargo will benefit Canadian mills by eliminating competition in such products as they

PRICE FLUCTUATIONS OF TIN AND COPPER DURING 1914-1915-1916-1917.

manufacture. It is apparently having a tendency to keep prices up, which is also favorable to the domestic steel industry. It is believed in the trade that prices will remain more or less stationary for an indefinite period and that the ultimate downward movement will be gradual.

tain and France will then be in a position to supply a large tonnage of steel for reconstruction and they will not have to rely upon the United States to the same extent as they do now.

It is generally conceded that there will be a period of depression in Canada, as in other countries, after the war and creased their producing capacity, which under normal conditions would tend to lower prices, based on the law of supply and demand. It is not unlikely that as a result, they would, as has been done in the past, cut prices on export orders, thus heading off competition. Under such conditions as these Canadian mills

PRICE FLUCTUATIONS OF ANTIMONY AND SPELTER DURING 1914-1915-1916-1917.

Future Prospects

What the future holds for the steel industry in Canada is a difficult question to answer. For the duration of the war there will likely be no material change in the situation. While the war lasts there will be an enormous demand for steel and the mills in Canada and the States will be kept operating at capaccity. What the demand will be after the war is problematical. It has been asserted that the demand for steel during the reconstruction period in Europe will be such that the mills on this side will have all the business they can take care of. Against this it must be remembered that the mills in Great Bri-

with it a falling off in the demand for steel. While admitting that this may be the case, the Canadian steel concerns were never in better shape to meet a period of dull trade, so there is little fear of trouble in this respect. The question as to whether our steel companies can participate in export trade after the war is also a difficult one to answer.

The main point is, can they compete with the mills of the United States? At present this does not appear possible. In the past, they have not been able, so it is difficult to see how they can succeed in the future, under normal conditions. The U. S. mills have considerably in-

would be handicapped in export business as it is doubtful if they could come down to American prices.

Canadian steel mills are not at the present time able to compete with mills in the States in producing a number of steel products, principally plates and structural shapes, which eliminates them from much profitable business, both domestic and export. It is also doubtful if they can compete in many other lines as their production costs are higher. If legislation were enacted by the Dominion Government to increase the tariffs on steel products, it would benefit Canadian mills for domestic trade. Canadian steel companies are now financial-

ly able to develop their trade connections by manufacturing new lines and something may yet be done to develop the industry. The producing capacity having been increased, the mills will have little difficulty in filling any business that can be obtained. The prospects for trade in the future in spite of keen competition are without doubt better than in the past.

NON-FERROUS METALS SITUATION

THE outstanding feature in the non-ferrous metal markets has been the entry of the United States into the world war, this resulting not only in increased consumption but also bringing all markets under the control of the Government there. It was, however, only during the latter part of the year that the Government stepped in and asserted its authority, therefore, the real benefit of this action is only just being felt and incidentally appreciated. As a result of this move prices have a lower tendency, speculation has been almost entirely eliminated and trading conditions have improved. Generally speaking, the markets have been steadier this year than last. There have, of course, been fluctuations in prices, but the up and down movements have as a rule been less violent. The metal trade has become more accustomed to war time conditions and consequently the situation has been under better control. An exception may perhaps be made in the case of tin, but this market is controlled by the British Government and has been recently seriously affected by war time conditions.

Production which has probably now reached its maximum for all metals is being readily absorbed, supply and demand being now fairly equal. In the case of spelter, however, the market has suffered from over production, resulting in a steady decline in prices. The situation as regards output and consumption of all metals is more stable than in the preceding twelve months. There have been shortages of metals at different times, of course, for varying periods, but in each case the situation has been relieved.

U.S. Government Requirements

Not long after the United States entered the war, there was a general impression that the Government there would ultimately take a hand in the situation to ensure a sufficient supply of metals for its needs. A close investigation of the industry both as to production and prices was made by competent officials and eventually a policy was decided upon. Before any direct action was taken, however, the U.S. Government purchased metals at its own prices, which were considerably below the market quotations current at the time. Take as an instance, copper. The Government purchased a considerable amount of this metal in the spring at 16½c per lb., at which time the market price in its home market was about 34c. Again in July the U.S. Government paid 25c when the regular price was still over 30c per pound. The same policy was adopted in regard to other metals. This was sufficient indication as to what would ultimately develop and as a result prices became easier and declined steadily.

At the present time, the price of copper is fixed and supplies are being distributed by a board appointed for the purpose. An announcement is expected any day now covering fixed prices on lead and spelter and possibly aluminum, while a revision of copper prices may be made. The supply of tin being almost altogether controlled by the British Government cannot be regulated as to prices by the American authorities. Antimony is in much the same position as tin as it is not produced in the United States.

Canadian Metal Situation

The situation in Canada has been dominated by the conditions prevailing across the line. The greater part of the copper, lead and spelter used in Canada comes from the States and prices here consequently are regulated by those prevailing there. Although tin and antimony are not produced in the U.S., prices of these metals in Canada are practically regulated by the New York quotations. New York is thus generally spoken of as being the primary market. To understand the metal situation in Canada it is necessary to follow closely developments in the United States, for conditions existing there are usually reflected in the Dominion.

Canada still relies largely on the States for supplies of metals in spite of the fact that considerable quantities of copper, lead and spelter are mined within her borders, but as they have to be sent to the States to be refined, the market for these metals is practically controlled in the States. Satisfactory progress is, however, being made at Trail, B.C., where the Consolidated Mining & Smelting Co. have built a large refinery. The production at Trail is 360 tons of copper, 1,700 tons of lead and 1,200 tons of zinc per month. Considering that this is a new Canadian industry, so to speak, the results are most gratifying.

Copper

There has been no lack of interest in the copper market this year and the red metal continues in the front rank of importance for the manufacture of munitions and other war supplies. The demand for copper has been exceptional, but at no time has it been beyond the capacity of the refineries, except during the strike period. Strikes at the mines in July, which lasted for several weeks, created considerable anxiety in official circles and cut down production, creating an acute shortage for a time. The evil effects of the strikes still remain, but it is understood that there is now sufficient supply on hand to take care of all requirements. Mine and smelter production of copper will this year be under the 1916 record-breaking total, as evidenced by the fact that the output of twenty-three properties of North and South America for the first eleven months of this year dropped about 55,000,000 pounds below the total noted for the corresponding period of a year ago. These properties turned out to December 1 approximately 1,517,585,000 pounds of copper, against 1,572,500,000 pounds in the first eleven months of 1916. It is estimated that the actual loss in mine and smelter output in the United States due to strikes exceeded 100,000,000 pounds, but against this there was an increase of 40,000,000 pounds in the amount produced by the three American-owned properties in Chile and Peru.

In the first three months of the year prices steadily advanced from 38c to 40c, this figure proving to be the maximum, about the middle of March. About this time the United States Government purchased about forty-five million pounds of copper at 16½c. Being a long way below the current New York price, the market consequently weakened. Prices, however, did not decline very much until the same Government in July purchased another large quantity at 25c per pound; again much lower than the market. This was a further indication that lower prices for copper would eventually be established and the market naturally continued to decline. In October the American Government appointed a Copper Producers' Committee to which was entrusted the distribution of copper for the U.S. Government and the Allies, and the division of what was left among domestic consumers.

About the same time the price was fixed at 23½c per pound. The market under control assumed a routine character and has been steady here since. Prices in Canada eventually declined to approximately 32c per pound. There is some talk of a revision of prices and it is possible that 25c may be fixed, but no definite announcement has yet been made.

Tin

The average price of tin has been higher this year than in 1916, for the most part due to a shortage, varying in intensity. No tin can be shipped to this continent without a permit from the British Government. For reasons not altogether easy to explain in this brief space, permits have been difficult to obtain and supplies have been coming over in comparatively small quantities, particularly during the latter part of the year. The shortage of tonnage is to a lesser or greater extent responsible for this condition, in any case the result has been very low stocks of tin on this side.

Since the United States entered the war, the demand for tin plate has greatly increased for use in the manufacture of containers, cans, etc., for supplies for the army. For this reason the demand for pig tin has greatly increased, but supplies have not been received in sufficient quantities to take care of the increased demand. An acute situation has developed owing to the serious shortage and the United States Government contemplate making an effort to have a sufficient supply released to meet its needs, which continue to increase.

At the beginning of the year tin was quoted at 47c, but made a sharp advance in February to 58c. There was another sharp advance in price in May to 68c, followed soon after by a decline to 66c. The market for a while was steady, but

Cost Reducers for Shell Makers

SPECIAL PURPOSE SHELL TOOLS

Designed for use in our own Factory and found so satisfactory that other Shell Factories have asked for and been supplied with them:

- Boring Lathes
- Base Boring Lathes
- Waving Lathes
- Band Turning Lathes
- Hydraulic Band Presses
- Shell Grinding Machines
- Shell Cleaning Machines
- Undercutting Machines
- Finish Tapping Machines
- Inside Profiling Machines
- Nicking Machines
- Centering Machines

We can supply any of the above complete, ready for use, **at about half the cost of ordinary tools for the same purpose**, or we can furnish you with **a complete set of castings** ready for you to machine and set up.

We have sold these to many Shell Factories in Canada, and have had many testimonials regarding their good qualities and economy in use.

Marsh & Henthorn, Limited
Belleville - - Ontario

Jardine's

GIANT

Has an anvil block of ample weight to endure under the shock of blows, and its solidity throughout makes for quantity work of exceptional quality. It's a

POWER HAMMER

that has never failed. Pitman is phosphor bronze. Hammer slide is a steel casting; so is the ram, and connecting bolts for the ram are machined from solid steel bar. Hammer and anvil dies of highest-grade tool steel, properly tempered, are held in machine seats by tapered keys in the ram and anvil block, so there's no need to put taper on the dies. REGISTERED J TRADE MARK

The Standard Authority on Modern SHOP PRACTICE

6 Vols. 2300 Pages-2500 Illustrations
Flexibly Bound in Genuine Leather Gold Stamped

Money Makers—Money Savers

These books contain all the latest, practical shop knowledge. You should have them. Know everything the boss knows. 10,000 questions answered. All the latest successful shop problems solved; all the latest machinery explained and described. Thorough and authoritative shop knowledge, classified and cross-indexed for easy reference. For beginners or experts. Money-makers and money-savers. You can now get them on the easy payment plan, which anyone can afford.

MODERN SHOP PRACTICE

Six large volumes prepared by experts to help the ambitious man to a better job with more pay. An authority on all modern shop methods. 2,300 pages (5½ x 8¾ inches), 2,500 illustrations, plates, tables, diagrams, etc. Cross-indexed for quick, easy reference. You can save 35% by taking advantage of this special advertising offer now. The regular price of these books is $30.00. You can now get them for $18.00; send coupon now.

ALL ABOUT:
Machine Shop Work Production—Modern Manufacturing—Machine Shop Management — Metallurgy — Welding—Die Making—Tool Making—Jigs—Fixtures—Tool Design—Foundry Work (Molding, Casting and Forging)—Pattern Making—Mechanical Drawing—Machine Drawing—Auto Shop Work. Nearly two thousand subsidiary subjects, all cross-indexed for easy reference.

50c. a Week

Act quick! Fill in and mail us the coupon to-day. Don't send us a cent. We will ship you entire 6-volume library without delay. You pay only net shipping charges when the books arrive. Read, study and refer to the books for one full week—7 days. Then if you decide to keep them, send us only $2 and $2 a month (50c a week) until this special price of $18.80 is paid. Then the books are yours and you get one year's consulting membership free. If you can get along without them at the end of a week, return them at our expense. This offer is open to everyone in the bounds of U.S. and Canada.

FREE
CONSULTING MEMBERSHIP

With each set of books we give free one full year's consulting membership in the American Technical Society. This permits you to present all your perplexing problems to our corps of experts. All will be solved quickly and thoroughly. There is no limit to this service. Ask as many questions as you want for one full year. All will be solved for you—FREE.

Let these "Shop Books" RAISE YOUR PAY

SEND COUPON

American Technical Society,
Dept. M-7739, Chicago, U.S.A.

Gentlemen:—I wish to examine for 7 days, your six-volume library of Modern Shop Practice. I will pay net shipping charges when the books arrive. If I decide to keep them I will send you $2 in 7 days and $2 a month until the special price of $18.80 is paid. Then the books are mine and also the consulting membership for one year. If I can get along without them I will return them at your expense.

easier, working back to 62c about the end of September. Early in November it became excited and prices advanced rapidly to 80c, at which level it still remains. If the authorities at Washington are able to influence the British Government to modify existing regulations thereby allowing a more liberal supply of tin to come forward there will likely be a drop in quotations.

Spelter

Spelter has been relatively the weakest of all the metals, due principally to the fact that the producing capacity of the refineries in the United States has increased to a greater extent than consumption called for. There has, of course, been a good demand, but the producing capacity was increased out of proportion to the consumption with the result that prices have been consistently weaker than those of last year, in fact the average price has been lower than the average for 1905. The zinc production of the United States has dropped over 30 per cent. from the highest levels attained when all plants, old and new, were running at full. This would indicate a curtailment of approximateiy 240,000 tons in the annual rate. During the first half of 1917, zinc was turned out at the rate of over 722,000 tons per annum, while in the ensuing quarter it was cut down to a basis of about 626,000 tons a year. The higher figure represented the top notch of spelter production resulting from increasing capacity for existing plants and the construction of many new smelters throughout the West. Production of zinc in Canada has increased this year, the largest refinery, located at Trail, B.C., turning out about 1,200 tons a month.

The highest price for spelter was early in March, when it touched 14c. It has since steadily declined until now it is quoted at 10½c per pound. The spelter market has also been affected by the proposal to fix prices, and has been weaker in consequence. After some delay the American Government early in December took the initial step in this direction by fixing the differentials. The latter for the U.S. Government prices between prime Western and the grades A and B were fixed at an advance of ¼c to ½c for brass, 2c for grade B and 3c to 3½c for grade A. The base price or the price of prime Western, however, has not been established, but will likely be so in the near future.

Lead

The lead market has been strong for the greater part of the year and the highest price since the beginning of the war was reached during the month of June. For the greater part of the year there has been a shortage of lead, varying in degree, which has resulted in the abnormally high prices affecting a number of lead products. At the beginning of the year lead was worth 9½c per pound. In February there was a sharp rise in price to 12½c followed by a steady advance which culminated in the record price of 14½c about the middle of June. In July the situation became easier and prices gradually slipped back, accompanied by some fluctuations, until September, when there was a sharp decline to 12c. The price ultimately dropped to 8½c, at which point it has been stationary for more than two months. The readjustment in prices was due more than anything else to the pending control of the market by the American Government, and by its purchases at a figure considerably below the market at the time.

The situation in regard to the supply of lead became easier during the latter part of the year until quite recently, when a scarcity developed. Prices, however, are not likely to change materially until the situation clears up following the action of the American Government. Even then it is doubtful if there will be any pronounced movement in either direction, for when the price is fixed the market will become steady.

Good progress has been made in the industry in Canada this year. The refinery at Trail is now producing lead at the rate of 1,700 tons per month and it is likely that the output will be increased in course of time. The Imperial Munitions Board have agreed to purchase the entire production of this refinery until March, 1918. The Board recently placed an order for 6,000 tons of lead with the Trail refinery. A few months ago the Dominion Government placed an embargo on the exportation of lead and zinc into the United States, but this order was eventually lifted following representations by the Provincial Government of British Columbia.

Antimony

The antimony situation this year has differed little from 1916, although the price has not advanced to the same extent. This metal owes its present importance entirely to the war and consequently the consumption has been fairly heavy. Practically all the antimony used on this continent now comes from China, English antimony being off the market. The production of Chinese antimony has been increased considerably during the past few years and the supply and demand is now fairly even. Shortages of varying duration have existed at different times, but the situation in this respect has never been very serious. The market has been devoid of any particularly exciting feature, although prices have been subject to some fluctuations.

At the beginning of the year antimony was worth 18c per pound, but made a sharp advance in February to 35c, reaching the high water mark, 36c, about the middle of April. Early in May weakness developed and prices declined until about the end of July, to 20c, remaining steady at this figure until September, when the price dropped to 19c, and in November to 18c, at which point it remained stationary. The price has thus worked back to the point where it started.

Aluminum

Conditions in the aluminum market this year has been practically a duplicate of those existing in 1916, doubtless due to the fact that the output of this metal is controlled, and as a result it has been sufficiently scarce to keep prices very high. The market has been more or less featureless during the entire year with no developments to create more than passing interest. Prices have been steady. For the first six months of this year, quotations were unchanged at 68c, which was, with the exception of two months, the same level as last year. In July prices dropped to 65c and in August to 64c, finally touching 62c in September and remaining stationary at the latter price for the balance of the year.

TRADE GOSSIP

Owen Sound, Ont.—The Town Council has granted J. H. Cole six months extension in the time allowed the Steel Corporation in its agreement with the town.

Kingston, Ont.—The Donnelly Wrecking Co. has been awarded the contract to raise the steamer Lehigh, which sank in the Welland Canal with a coal cargo while en route to Montreal.

W. H. Miner, who was elected to the directorate of the Southern Canada Power Co. recently, at the annual meeting in Montreal, is president of the Miner Shoe Co., Maisonneuve, and vice-president of the Miner Rubber Co., Granby, Que.

St. John, N.B.—Fire on Dec. 17 destroyed the factory of the National Clothing Manufacturing Co. The building was a four storey brick structure. The total loss is in the vicinity of $125,000, and is covered by insurance.

Baldwins Build One Locomotive an Hour.—The Baldwin Locomotive Works, of Philadelphia, are now turning out steam engines at the rate of one every hour, and this, officials say, is not the maximum accomplishment. Most of the engines are being sold to the United States Government and to foreign governments.

British Steel Concerns Merge.—Advices from London, England, state that arrangements have been made for the amalgamation of four prominent iron and steel companies—the Worthington Iron and Steel Co., of West Cumberland; the Phoenix Steel Works. of Rotherham; Samuel Fox and Co., of Sheffield, and the Frodingham Iron and Steel Co., of Lincolnshire. The capital will be at least £4.000.000 sterling. The total weekly output is about 25,000 tons of iron and 21,000 tons of steel.

Trading Firms Amalgamate. — Announcement was made a few days ago that the business of the Frontier Trading Co., of Ogdensburg, N.Y., and the Canada Shipping Co., of Montreal, had been taken over by the George Hall Coal & Transportation Co. The deal gives the Hall Co. an extra fleet of sixteen vessels with an aggregate tonnage of 20,000. The vessels will be placed in the coal and wood pulp trade between ports on Lake Ontario and the St. Lawrence River. Four vessels owned by the Hall Co. were commandeered recently by the United States Government.

"STERLING" HACK SAWS

These heavy duty blades are suitable for any machine. A machine will give its maximum of efficiency only when equipped with a thoroughly high class blade. The trade mark at the top of this page completes the story.

The same trade mark is used on blades for hand frames, lengths, widths, pitches and gauges being made to give the best results on all classes of work.

Westmount Building Statistics.—The building permits issued during the year for the City of Westmount, Que., numbered 70, of an estimated value of $147,190.

Crow's Nest Pass Coal Output.—The collieries in the Crow's Nest Pass district of British Columbia, which are now operated under Government control, are producing 23,000 tons of coal a day, the greatest output in the history of the province. Word received by the Minister of Labor from the Director of Coal Operations in the district indicates that everything is running smoothly at the collieries.

Coal By-Products.—The by-products obtainable from coal are numerous and important, and the best authorities contend that it is unwise to burn it in the ordinary way. When burned under boilers to produce power, less than 15 per cent. of the heat units in the coal is utilized. By low carbonization, the valuable light and heavy oils are obtained, the gas can be used to generate power and the residuum coke containing nearly all the original fixed carbon can be burned in the ordinary way to produce heat and power.

Revision Unlikely in Steel Prices.—Advices from Pittsburgh state that there will be no revision of iron and steel prices January 1, and it is quite unlikely that there will be any important revision soon after that date. The War Industries Board evinces no desire, of its own initiative, to seek any revision. The Federal Trade Commission evidently feels that there should be more recognition of the large amount of cost data it has gathered, and is still receiving, but as it is back of the Pomerne iron and steel price-fixing bill that is to be pushed in Congress, it may be disposed to bide its time and not push the matter forward before the expected legislation is enacted. The opinion in steel circles is very strong that there should be no revision. The market needs stability, which it now has, and what it would lose in stability, through a revision, would greatly outweigh any slight irregularities that may exist in the present price schedule.

Large Order for Wooden Ships.—The Foundation Co., Inc. of New York, has received orders from the United States, French and British Governments for forty-five wooden ships, aggregating $20,000,000. Most of the work is being done on a "cost plus" basis. Additional large ship orders are also under negotiation and will probably be closed within the next few weeks. The order for the United States Government is for the hulls for ten 3 000-ton wooden steamers which are to be built at the company's yard at Newark, N.J. The contract from the French Government was closed some months ago and calls for thirty wooden sailing vessels of 3 000 tons each. These boats are to be fully equipped and will have auxiliary steam engines. The order from the British Government is for the hulls for five wooden steamers, 2,500 tons each, and these are being built at the company's yard at Victoria, B.C. The first of these will be launched next week and deliveries completed in April, 1918.

"Barnes-made" SPRINGS

are the result of over sixty years' experience in spring making, combined with unsurpassed equipment and the workmanship of men who have been with us, ten, twenty and in some cases thirty years.

Market Condition and Tendency

Holiday Season Affecting Business—Shortage of Steel for Ordinary Commercial Purposes But Prices Firm and Unchanged—Tin Advances But Other Metals Unchanged.

WITH the holiday season restricting industrial activity, trade is quiet with no change of importance to note in the situation. Existing conditions will prevail for the balance of the year. The iron and steel trade is quieter than usual at this time of the year which may be accounted for by the fact that the shortage of steel for ordinary commercial purposes is restricting manufacturing operations. It is not unlikely that many of the so-called non-essential industries may ultimately have their operations still further restricted owing to the increase in demand for steel for war purposes. The situation in the pig-iron market is unchanged. The shortage of coke in the States continues to curtail the output of pig-iron as additional furnaces have been banked. The severe weather has affected the railways, increasing transportation difficulties. The price of tin has advanced on account of scarcity and the situation in regard to this metal is more acute. The market for copper is unchanged. The machine tool market continues steady with a fair volume of business passing. Prices of machine shop supplies are holding firm.

MONTREAL, Que., Dec. 22, 1917.—Business conditions have now become normal following the elections, but until the Christmas and New Year holidays are over, it is not expected that vigorous activity will be renewed to any great extent. Transportation conditions are less acute owing to the recent break in the weather.

Steel

The priority regulations are maintaining munitions plants and other essential manufacturing with sufficient raw materials but general consumers are experiencing greater difficulty than ever in covering their requirements. The holiday traffic has added to the transportation problems of the railroads and a considerable condition of congestion exists in some localities. The Canadian steel situation is unchanged, with manufacturers and dealers waiting further developments in the United States. Dealers report a very strong market with prices unchanged but virtually nominal in most instances.

Metals

The metal situation is still more or less unsettled owing to the pending developments on the other side. Copper is steady but quiet. Tin is still at nominal quotations and very scarce both here and in the States. Spelter is more active and showing strength. Lead is firmer. Antimony and aluminum are both firm and unchanged.

Toronto

TORONTO, Ont., Dec. 24.—A big increase in the trade of the Dominion is shown in a statement for November recently issued by the Department of Customs. The total volume reached almost two billion dollars for eight months of the final year, which closed November 30. Manufactures, in point of value, headed the list, the products of Canadian factories sent out of the country being to the value of $489,327,640 as compared with $263,580,148 for the corresponding period last year.

Iron and Steel

On account of the holiday season the

steel market is quiet and there is no change in the situation, as reported last week. The volume of business has been falling off for some weeks, due to the increasing difficulty that is being experienced in obtaining supplies of steel for ordinary commercial purposes, as so much steel is being diverted for war equipment. It is within the range of possibility that many of the so-called non-essential industries may have their operations still further restricted owing to the Government requirements.

Conditions in the pig iron market are unchanged from last week. Production in the States continues to decline on account of shortage of coke, due to transportation difficulties, more furnaces having been banked because of coke deficiencies. It is feared that the output of the furnaces will fall behind during the winter instead of increasing as was hoped.

Metals

The outstanding feature this week continues to be the shortage of tin, with the result that there has been a further advance in price. Receipts of tin on this side are very light and the demand does not decrease. The market is very unsettled, as there is considerable uncertainty not only as to price, but also as to actual delivery. The copper market is quiet and prices unchanged. There is some doubt as to what may be done in regard to revision of copper prices, but the opinion is generally held that the present schedule will not be changed.

A scarcity of spot lead has developed in New York and the market is firm. The "Trust" price is unchanged at 6¼c, but on the outside market lead is quoted at 6½c to 6¾c per lb. No fixed price schedule for lead and spelter has yet been given out at Washington, but some announcement is expected almost any time. The antimony and aluminum markets are quiet. Tin, which is now quoted at 82c per lb., is the only price change. Current prices on metals are given in the selected market quotations.

New York

NEW YORK, Dec. 21.—Great activity developed in the machinery trade last week in the interior markets, especially at Cleveland, where both sales and new enquiries were larger than during any previous week this year. Several large sales were also made in Chicago and in New York. At New York, however, buying was less general and smaller in volume than for several weeks. The government is still the principal purchaser in the Eastern territory where it continues to secure tools for various arsenals, the Washington Navy yard and for the ordnance repair depot in France. Recent enquiries have developed the fact that there is almost a veritable famine in large machine tools and the government has been warned that if speedy action is not taken to immediately secure large tools that it will be unable to obtain more than 25 per cent. of its requirements. The demand for large heavy tools has recently been so great that fabulous prices are being paid for second-hand units of obsolete type.

PURO

(MADE IN CANADA)

Saves Dollars

Why let that old-fashioned faucet go on year after year wasting water—MONEY?
Why more drinking cups and glasses, only to become unsanitary—lost, broken or carried away? Puro Sanitary Drinking Fountain stops all this needless waste. Puro saves you 35% on the water bill alone. Puro saves you all that money you spend for cups. YET Puro is always ready with a clear, cool drink with dollars in the bank.

Puro Pays for Itself

You don't have to wait years to get back the small investment you have tied up in Puro equipment—
You start cashing in at once—not only on your water bill saving, but on the increased efficiency of your workers as well.
Men like PURO—it's clean. No danger of deadly germs lurking in its sparkling bubble.
Write us—tell how many men, how many departments, and we'll tell you how much the cost will be to

The U.S. Army and Navy Departments are still competing in the purchase of machinery and naturally a conflict in priority of orders ensues. There is a heavy demand for rivets from ship builders and the Emergency Fleet Corporation has distributed orders for about 15,000 tons for shipment to Eastern yards. The Navy Department has given out orders for valves needed in the construction of submarine and torpedo boat destroyers.

PITTSBURG, Pa., Dec. 22.—It seems to be well established that no effort will be made at Washington to revise iron and steel prices at this time. If there is any revision it will probably occur after the fate of the Pomerene Iron and Steel Price Fixing Bill has been determined. This measure will probably be pushed by the Federal Trade Commission, and probably with a provision that some existing contracts can be suspended or abrogated entirely. The commission seems to be convinced that there are in existence some contracts, particularly for intermediate materials, that interfere with the system of uniform prices.

There are practically no offerings of pig iron by the merchant furnaces in the Pittsburgh and nearby districts. An occasional odd lot of prompt foundry is furnished as an accommodation, and there is some to be bought for second quarter and second half delivery. There are no offerings at all of basic or Bessemer.

Regular contract buyers of billets and sheet bars are being fairly well taken care of by their respective mills, but the consumer without a regular mill connection finds it almost impossible to buy soft steel. The offerings of shell steel discards continue to increase, but they are not well absorbed, although offered in billet form at about $2.50 less than the prices set for soft steel.

The sheet mills sold quite a tonnage of sheets in November after prices had been set, and with output restricted as it is at present they have little to offer. Sheet mills are operating at an average of only 50 to 60 per cent. of capacity.

Chain makers have promulgated a new list on chain, which ignores entirely the prices recently named by the American Iron and Steel Institute. This new list is based on 8.30c for 1-inch, ⅜-inch being 9.20c.

The whole iron and steel market has been extremely quiet, there being scarcely any commercial transactions. Government orders continue to be alloted as freely as formerly, but details are withheld. It is stated that 1,200,000 tons of shell steel has now been distributed, the whole programme involving 1,500,000 tons, all for shipment by the middle of June.

Quebec City Building Statistics.—The value of building permits issued between January 1 and December 15 this year totalled $2,457,516, as against $2,912,157 for the twelve months ending December 31 last year. The outlook for the New Year is reckoned none too bright.

The MacLean Business & Class Publications in Canada

TO SELL or buy from Canada such lines as machinery, hardware, food products, dry goods, books and stationery, paper, printing machinery and supplies and general merchandise of almost every description, raw or manufactured, use or consult the MacLean Business and Class Publications, as per list below. For special information, write the publishers. Concerning the quality of the MacLean publications, let this copy of CANADIAN MACHINERY which you hold in your hands speak for all. The MacLean list of 14 publications is as follows:—

Canadian Grocer (Est. 1886)
Serving the Grocery, Provision and Food-stuffs Trades. Published weekly.

Hardware and Metal (Est. 1889)
Serving the Hardware, Stove and Metal-working Trades. Published weekly.

Dry Goods Review (Est. 1889)
Serving the Dry Goods Trade generally; Wholesale, Retail, Manufacturing and Department Stores. Published monthly.

Men's Wear Review (Est. 1898)
Serving the Manufacturers of Clothing, Underwear, Shirts, Collars, Neckwear, Footwear, Hats and Caps and Allied Sundries, and their Retail Distributors. Published monthly.

Canadian Machinery (Est. 1905)
Serving the Machinery, Metal-Working, Iron and Steel, Foundry and Allied Trades. Published weekly.

Power House (Est. 1907)
Serving the Operating and Consulting Engineers and Power Superintendents. Devoted to the Generation, Transmission and Application of Steam, Gas, Electric, Air and Water Power; and to the operation of Refrigerating Machinery. Published monthly.

Bookseller and Stationer (Est. 1884)
Serving the Book, Stationery, Fancy Goods and Associated Trades. Published monthly.

Sanitary Engineer (Est. 1907)
Serving the Manufacturers of Sanitary, Heating and Ventilating Machinery, Systems and Equipments, and those installing them. Published semi-monthly.

Marine Engineering of Canada (Est. 1910)
Serving the Marine Engineering, Merchant and Shipbuilding Trades. Published monthly.

Canadian Foundryman (Est. 1909)
Serving Foundries and the Pattern-Making, Plating and Polishing Trades. Published monthly.

Printer and Publisher (Est. 1892)
Serving the Publishing, Printing, Paper-Making and Allied Trades. Published monthly.

The Financial Post of Canada (st. 1907)
Serving the Business, Investment and Financial Interests of Canada. Published weekly.

MacLean's Magazine (Est. 1896)
A popular family and literary magazine; the most important in its field in Canada. Published monthly.

Farmers' Magazine (Est. 1910)
Serving the agricultural and rural communities of Canada. The only farm and country life publication in Canada having extensive national circulation. Published semi-monthly.

This fact may interest you: namely, the MacLean organization is the largest concern of its kind in the British Empire. The output of its mechnical department every working day is the equivalent of a 112-page publication of the size and ty of this copy of *Canadian Machinery*.

Our London Office, 88 Fleet Street, E.C.

For over 20 years the MacLean Publishing Company has maintained a fully-staffed London office, and has rendered British and Continental manufacturers, shippers, and traders an invaluable service in many directions.

AGENTS WANTED

WANTED — LIVE REPRESENTATIVE TO handle good specialty; one who hasn't too many irons in the fire Apply Box 348, Canadian Machinery, stating lines you now represent and the ground you are prepared to cover. c23m

WANTED—PARTY TO TAKE OVER CANAdian and European patents of good paying machine. The machine, which costs less than thousand dollars to build, is in daily operation in Pittsburgh steel mill, with a saving of thirty dollars per day. Apply to Box 356, Canadian Machinery. (c25m)

SPECIAL MACHINERY

H. C. THOMAS, GENERAL MACHINE SHOP, tools, jigs and machine repairs. 301 King St. W., Toronto. Telephone Adelaide 3836. tf

MANUFACTURERS—WE CAN UNDERTAKE work to any specification—munition production equipment or otherwise. Write W. H. Sumbling Machinery Co., 7 St. Mary St., Toronto.

LET OUR MACHINE SHOP HANDLE YOUR overflow. We have a well equipped shop and can handle turret lathe, engine lathe, shaper, drill, screw machine work, as well as fitting. We will gladly quote you prices. Webber Bros. Machine Co., Dupont St., Toronto. (c26m)

4.5" Shell Machines

The following machines successfully used on 4.5" shells are offered for sale at prices that are especially attractive:

1—No. 6 "Hall" cut-off.

1—Nosing press 14" x 24".

1—Banding press, 6-6½" cylinders.

1—"Bertram" wave rib attachment.

1—"Lymburner" copper band turning attachment.

1—"Matheson" nose nick miller.

The "Hall" machine can be inspected in Toronto, the others at our works.

Agencies Wanted

for ENGLAND, the BRITISH ISLES or the whole of

EUROPE

We are open to accept a few first-class agencies. Nothing too small or too large to handle, providing they are profitable.

Now is the time to fix up for business after the

WAR

We have works and warehouses in Manchester and London with branches in Belfast and Glasgow with facilities for handling knocked down articles to be assembled in England.

Full particulars to:

CRAVENS' PATENT, Limited

MANCHESTER, ENGLAND

Automatic Multiple Punch

By D. Bergue & Co., Manchester, Eng.

SPECIFICATIONS:

CAPACITY TO PUNCH.....18 7/8" holes in 7/8" plate, or 20 3/4" holes in 3/4" plate, or 27 5/8" holes in 5/8" plate.

Each punch is independently adjustable for centers. All punches can be operated together or any individual punch can be instantly thrown out of action.

EQUIPMENT.....1 set 18 7/8", and 1 set 27 5/8" punches and dies.
TAKES PLATES.....26' long by 6' 6" wide.
DISTANCE BETWEEN HOUSINGS.....7' 0"
STROKE OF RAM.....3"
DIE SPACE—STROKE UP.....12"
WIDTH OF FACE OF RAM.....12"
(to which punches are secured)
WIDTH OF TABLE.....18"
(to which dies are clamped)
TABLES.....Extend for a distance of 29' 0" in front and at rear of machine measuring from center line of punches, which is ample for 26' plates.
PLATES ARE FED INTO MACHINE AUTOMATICALLY by means of rollers in tables. Feed is controlled by operator from front of machine.
BELT OR MOTOR DRIVE.....Motor drive is recommended, motor being directly belted to driving shaft.
Driving pulley.....10" x 7½"
Fly wheel.....64" x 6"
Driving shaft is double geared into main shaft.
Main shaft.....12" diameter.
WEIGHT.....About 50,000 lbs. net.

Condition equal to new

24" Bullard Vertical Turret Lathe, turret head and one side head.
No. 00 Baker Keyseater.
6" x 48" P. & W. Thread Miller.
Industrial Gas Hardening Furnace with blower and pyrometer.
No. 2 B. & S. Plain Milling Machine.
No. 3 Cincinnati Vertical Milling Machine.
20 H.P. Nash 2-Cylinder Vertical Gas Engine.
6 H.P. Fairbanks-Morse Horizontal Gas Engine.

STOCKER-RUMELY-WACHS COMPANY

117-121 NO. JEFFERSON STREET CHICAGO, ILLINOIS

USED MACHINE TOOLS

AUTOMATIC SCREW MACHINES.

Acme No. 56 Multiple Spindle Automatics.
New Britain No. 24 Automatic Chucking Machines.
Gridley 1¾" Multiple Spindle Automatics.
Gridley 2¼" Multiple Spindle Automatics.
Gridley 3¼" Single Spindle Automatics.
Gridley 4¼" Single Spindle Automatics.
Potter & Johnston No. 6A Automatics.
Potter & Johnston No. 5A Automatics.
Reed-Prentice 2XH Semi-Automatics.

DRILLING MACHINES.

Baker No. 310 High Duty Drills.
Moline No. 117 Single Spindle "Hole-Hogs."
Rockford 6-spindle Gang Drill.

LATHES.

Lo-Swing 3½" x 24".
Lo-Swing 3½" x 60".
Yound 10" x 5' Screw Cutting.
Seneca Falls 11" x 5' Screw Cutting.
Mann 12" x 5' Screw Cutting.
Reed-Prentice 14" x 5' Stud and Bolt.
Porter-Cable 9" Manufacturing Lathe.
Putnam 26" x 12' Screw Cutting.
Bridgeford 27" x 12' Plain Turning.
Huntington 27" x 12' Plain Turning.
Norwood Plain Turning Lathes, for shells up to 9.2".
Fay & Scott Gap Lathe, 32" x 50" x 12', Screw Cutting.

GRINDERS.

Modern 12" x 24" Grinders.
Blount 20" Wet Tool Grinders.
Blount No. 2 and No. 3 Dry Grinders.
Whitney 20" Wet Tool Grinders.

MILLING MACHINES.

Becker Large Hand Millers.
Van Norman No. 1 Hand Millers.
Garvin No. 2 Hand Miller.
Garvin No. 3 Hand Miller.
Pratt & Whitney No. 2 Hand Miller.
Sellers Lincoln type Miller.
Briggs No. 1, Type "A" Power Miller.
Lees-Bradner No. 3D Thread Millers.
Lees-Bradner No. 3C Thread Millers.
Knight Duplex Lincoln Millers.
Morris-Thompson No. 3B Thread Millers.

MISCELLANEOUS.

Cooper 3" Shell Grinders.
Fairbanks 50 lb. Model "A" Power Hammer.
West No. 4 12-cylinder Banding Press.
Williams 9.2" Cutting-Off Machines.
Gas Furnaces, 26" x 30" x 12" capacity.
American, Victor and Connersville Pressure Blowers.
National No. 5 Oil Separator.
Standard Bilton 6" Automatic Gear Cutter.
Ferracute No. DD-66 Drawing Press.
Leland-Gifford 2-spindle Profilers.
Garvin No. 1 2-spindle Profilers.
D. & W. Magnetic Chucks, 110 V.D.C., 7½" x 16" (4).
Allis-Chalmers 3" Band Turning Machines.
Racine No. 1 Hack Saws.
Williamson Metal Band Saws, Capacity 10".
15 H.P., 220 A.C., 50-cycle, 3-phase motors (15).

NEW MACHINE TOOLS.
(Miscellaneous.)

Porter 21" x 10' Screw Cutting Lathes.
Becker Large Hand Millers.
Pratt & Whitney No. 2 Hand Millers.
Garvin No. 1, 2-spindle Profilers.
Betts No. 12, P. & W. type Profilers, 2-spindle.
Detrick & Harvey No. 12, P. & W. type Profilers, 2-spindle.
Newton No. 12, P. & W. type Profilers, 2-spindle.
Heald Style "W.T.A." Drill Grinders.

The above list will give you an idea of the large assortment of machine tool equipment that we are in position to furnish immediately. All equipment is offered subject to prior sale. We shall be glad at all times to make quotations and send full description and condition of the machines mentioned. The "used" machines, in a good many cases, are actually as good as new, having seen very little service.

Inter-Continental Machinery Corporation

165 Broadway, New York.

Here's the Equipment You Want

Immediate Delivery. Good Working Condition.

SLOTTERS.

18" Betts, heavy type, circular table.
10" New Haven.

LATHES.

60" x 11' New Haven Pulley Lathe, two 48" face plates.
Six (6) 40" x 18' Pittsburgh Lathes, quick-change gear.
32" x 20' Rahn Larmon.
24" x 12' Lodge & Shipley.

VERTICAL BORING MILLS.

50" Bridgeport Bullard.
48" Colburn, 2 swivel heads.
Two (2) 42" Colburn, single head.

PLANERS.

40" x 40" x 14' New Haven, single head.
30" x 30" x 12' Cincinnati, 2 heads.
Two (2) 30" x 30" x 10' Pease, single head.
25" x 25" x 8' Sellers, single head.
24" x 24" x 6' New Haven, single head.
42" x 42" x 12' Pond Planer, 1 head on rail, 1 side head.
30" x 30" x 8' Powell Planer, 2 heads.

RADIAL DRILLS.

60" Hamilton.
48" Gang, tapping attachment.
48" Niles.

GRINDERS.

No. 5½ Bath Duplex.
No. 3 Bath Universal.
12 x 60" Landis Universal.
No. 2 Bath Universal.
10 x 30" Atlas Universal.
Two (2) No. 2½ Bath Duplex, internal.
No. 11 Landis Plain.

MILLING MACHINES.

Two (2) Newton Vertical Milling Machines, 6" main spindle; equipped with 36" heavy facing cutter heads.
No. 5 Brown & Sharpe, Vertical.
No. 1½ Cincinnati Universal, dividing heads, etc.
No. 2 Putnam Universal, dividing head, etc.
No. 2½ Garvin Universal, dividing head, etc.
No. 2 LeBlond Plain.

GEAR CUTTERS.

16" Bilgram Bevel Gear Planer.
Wm. Sellers Son, 54", Spur and Bevel.
Brown & Sharpe 24" Automatic.

PRESSES.

No. 54 Garrison Straight-sided Single Crank Press, weight 26,000 lbs., 5" stroke, 25" between housings
93-A Toledo, weighs 14,000 lbs.
92-B Toledo, weighs 9,400 lbs.
No. 35 Arch Press, weighs 5,000 lbs.
No. 3 Perkins Double Action Toggle Press.
150-ton Ferracute Knuckle Joint Coining Press
75-ton Ferracute Knuckle Joint Coining Press.

POWER HAMMERS.

15-ton Morgan Steam Hammer.
1000-lb. Billings & Spencer, Board Drop.
Two (2) No. 4 Nazel Pneumatic.
500-lb. Bell Single Frame Steam.
500-lb. Bradley Upright.
400-lb. Ferris & Miles Steam.
200-lb. Beaudry Upright.
Two (2) 200-lb. Bradley Upright.
One (1) 40-lb. Bradley Helve.

UPRIGHT DRILLS.

36" Foote-Burt Heavy Duty.
26" Barnes.
24" Foote-Burt.
24" Prentice.

PIPE MACHINES.

8" Eaton, Burnham & Coles.
6" Jarecki.

CRANE.

15-ton Alfred Box Co. Traveling Crane, single motor, 15 H.P., 220 volts, 40' span.

MISCELLANEOUS.

10' Hilles & Jones Boiler Plate Rolls.
No. 3 Newton Cold Saw.

Write for Stock List.

Machinery and Plant for Sale

LOCATION, BRITISH COLUMBIA

Plant completely equipped for manufacturing frogs and switches.

Equipment may be bought independent of plant.

Specifications: Modern Building, 100' x 200' on 7½-acre site. Ideal wharfage and C.P.R. spurs running into plant.

PRINCIPAL EQUIPMENT

MACHINERY

1—18" Barr Double Arm Punch and Shear.
1—26" Prentice Drill Press.
1—40" Buffalo Blower.
1—5' Bellers Radial Drill.
1—2-ton Chain Block and Swedge Block.
1—48" Espen Lucas Cold Saw, 2 blades.
1—72" x 72" x 14' Enterprise Planer, 2 heads and grinder head.
3—Air Hoists, 1 4', 2 7'.
1—2" Acme Bolt Cutter, 3 complete sets of dies.
1—12 x 12 Rand Steam-driven Air Compressor, with tank.
1—36" x 36" Niles Planer, with two heads.
1—45" x 12' Niles Two-head Planer, with extensions.
1—54" Putnam Gear Cutter, with cutters.
1—Gisholt Tool Grinder.
1—32" x 48" Brainard Slab Miller.
1—Power Hack Saw.
1—1½" Spindle Double-end Grinder.
1—48" Morton Draw-cut Shaper.
1—1210A Mason Boiler (T.P. 240, W.P. 160).
1—Dudley Car Frame and Trucks.
Several Electric Motors.

Complete Information and Inspection Upon Demand

The Call Switch Co., Limited

New Birks Bldg. - MONTREAL

(c1m)

FOR SALE

Large Blanking Press

76" between housings, 8" shaft,
3½" stroke, 8¾" die space.

Very good condition and for immediate delivery.

RIVERSIDE MACHINERY DEPOT

17-29 St. Aubin Ave. - - DETROIT, MICH.

If what you need is not advertised, consult our Buyers' Directory and write advertisers listed under proper heading.

MACHINE TOOLS—ANYTHING YOU WANT

BORING MACHINES—Vertical.
1—30" Bullard, 1 turret head.
2—32" Bullards, 1 turret head.
1—36" Bullard, 2 heads.
1—37" Bullard, 2 heads.
1—38" Bausch, 2 heads.
1—NEW 42" Gisholt, 2 heads.
2—10' Niles, 2 swivel heads.

BORING MACHINES—Horizontal.
1—2½" bar, Niles.
1—Bement, knee type, 2½" bar.
1—Williams Sellers, knee type, 2½" bar.
1—Binnse Knee Type, 2½" bar, for cylinder boring.
1—Beaman & Smith, 2-3" spindles.

BULLDOZERS.
1—No. 4 Ajax, 20" stroke.
2—No. 23 Williams & White, belt-drive.
1—No. 26 Williams & White, belt drive.

CRANES—Traveling.
1—8-ton Chisholm & Moore, 13½' span, hand power.
1—10-ton Toledo, 3 motors, 30' span.
1—10-ton Whiting, 48' 8" span.
1—10-ton Shaw, 72' span, 4 motors.

CRANES—Locomotive.
3—10-15-ton McMyler Broad gauge Steam Locomotive, 60' boom, bucket, 3 drums.
1—15-ton Browning, 8-wheel, 38' boom.
1—20-ton Brown Hoist, 8 wheel, 40' boom, bucket.
1—20-25-ton Industrial, 8 wheel, 50' boom, bucket.

CUTTING-OFF MACHINES.
1—4" Hurlburt & Rogers.
30—4½" Davis.
10—4½" Williams.
1—5" Hurlburt & Rogers.
6—8" Automatic.

DRILLING MACHINES—Radial.
3—NEW 3' Mueller, speed box drive; March del.
3—NEW 3' American, Sensitive, tapping attachment.
1—4' American, speed box drive, tapping attach.
1—4' Mueller.
1—4½' Full Universal, cone drive.
1—NEW 5' Western Plain, with motor.
3—NEW 5' Mueller, speed box drive; March del.
4—6' Reed-Prentice, latest type, belt-driven; January del.
1—NEW 6' Triumph, motor drive; February del.

DRILLING MACHINES—Heavy Duty.
2—D-2 Colburn Heavy Duty, 3½" cap., arranged for motor drive.
4—No. 25 Foote-Burt, heavy duty, 2½" capacity.
10—No. 310 Baker, single pulley drive, late type, arranged for motor drive.
10—Moline Hole Hogs, heavy duty, 2½" cap.

DRILLING MACHINES—Sliding Head.
2—NEW 25" Cleveland, high duty.
5—NEW 28" Sibley.
2—NEW 30" Sibley.
2—NEW 34" Barnes.

DRILLING MACHINES—Multiple Spindle.
1—NEW Cleveland, 4-spindle, ball-bearing.
1—4-spindle 20" Barnes, all geared.
2—6-spindle Rockford; Economy type.

GEAR CUTTING MACHINES.
1—No. 1 Schuchardt & Schutte Gear Hobber, spur and bevel.
1—No. 2A Newark, 24" x 8" cap.
3—No. 3 Brown & Sharpe Auto Gear Cutter, spur.
1—36" Newark.
1—30" Whiton, for spur and double gears.
2—36" x 9" Gould & Eberhardt, new type, spur gears.
1—15" Gleason Bevel Gear Planer.
1—20" Grant-Lees Gear Hobber, bevel spur and spiral attachment.
1—28" Rhemania Gear Hobber, spur and worm gears.
2—NEW 30 Flather, solid pattern.
1—36" Fellows Gear Shapers.
1—72" Gould & Eberhardt, spur and bevel.

GRINDERS—Universal for Cutters, Drills, Reamers, Etc.
5—NEW No. 190 Wells.
2—NEW Universal.
2—No. 1 Cincinnati.
1—NEW Gisholt Universal.
1—NEW Premier, Universal.
1—NEW Wilmarth & Morman, style B.X.
1—NEW Walker No. 1, outfit B.
2—NEW No. 2 Oesterlein Universal.

GRINDERS—Cylindrical, Plain.
2—American Waltham Precision, cap. 7" x 2½".
1—NEW 8" x 30" Modern Self-contained.
2—NEW 12" x 24" Modern Self-contained.
4—12" x 36" Modern Self-contained.
2—12" x 42" Landis Self-contained.
5—12" x 48" Modern Self-contained.
1—12 x 66" Landis.

GRINDERS—Cylindrical, Universal
1—NEW Thompson 10 x 36".
1—NEW No. 3 Modern, cap. 13" x 40".
1—No. 4 Cincinnati; capacity 12 x 72".

GRINDERS—Internal
1—No. 75 Heald.
1—1½ Landis.

GRINDERS—Disc.
1—NEW No. 4 Gardner, including disc press, 23" disc.
3—No. 14 Besley, including ring, wheel, chucks.
1—NEW No. 17 Gardner, 30" disc.

GRINDERS—Cylindrical.
1—No 60 Heald, single pulley drive.

GRINDERS—Surface.
4—NEW No. 1 La Salle Plain, with Micro. Adj.
1—NEW No. 1½ Walker's, complete.
4—NEW No. 2 Reid (Same as B. & S.).
1—3' Pratt & Whitney Vertical, Magnetic Chuck.
12—Carrigus type, mag. chuck.

HAMMERS—Board Lift Drop.
1—100-lb. Bradley upright, Beaudry type.
3—300-lb. McWilliams.
1—No. 4 Standard Machinery Co., 400-lb.
1—E. W. Bliss, 800-lb.
1—1500-lb. Toledo.
1—3000-lb. Williams & White.

HAMMERS—Steam Forging.
1—600-lb. Niles, single frame.
1—12-ton Bement.

KEYSEATERS.
1—Morton, 2" cap., 18" stroke.
1—No. 1 Catlin.
1—Colburn 4", capacity 43" stroke.
1—No. 2 Knowles, 60" stroke.

LATHES—Manufacturing, not Screw Cutting
2—NEW No. 3 Harding Brothers, Bench Lathes.
10—NEW 26" x 12' Simplex Shell Bor. Mill, 5" boring bar, quick-change gears; arranged for motor drive.
21—No. IX Reed-Prentice, 16" swing, single pulley drive.
4—Norwood, used on 9.2 English Shells.

LATHES—Engine.
2—NEW 12" x 5' Cleveland Tool Room Precision. geared head, taper attachment.
14—NEW 15" x 6' Rockford.
3—NEW 16" x 6' Cleveland Tool Room Lathes, complete equipment.
1—NEW 17" x 8' National Quick Change, Double Back Gears.
12—NEW 17" x 8' LeBlond Pan Bed, Quick Change Gears.
1—18 x 8 Prentiss, geared head, taper attachment, quick change.
3—20 x 8 Lodge & Shipley, quick change, turret on ways.
2—20" x 10' Lodge & Shipley, quick change.
19—NEW 21" x 10' Porter, S.B.G.
7—22" x 10' Putnam, oil pan and pump.
1—NEW 24" x 10' American, high duty, quick change.
2—24" x 10 Lodge & Shipley, quick change.
1—24" x 10' Schumacher & Boye, quick change, taper attachment.
1—NEW 26" x 48" x 12' McCabe Double Spindle.
1—NEW 26" x 16' Bridgeford pattern geared head, heavy pattern.
3—27" x 12' Bridgeford Heavy Duty, plain turning, 2 carriages, motor driven.
7—28" x 12' Bridgeport, geared head, heavy duty, taper attachment.
1—NEW 30" x 14' American Double Back Geared, Quick Change.
1—30" x 14' Lodge & Davis, patent head.
1—36" x 13' Putnam, face plate drive.
1—36" x 17' Pond, triple geared, quick-change.
1—36" x 16' New Haven, quick change.
1—36" x 20' American, triple geared.
6—40" x 18' Pittsburg, quick change, gear, face plate drive.
1—40" x 4' Niles, triple geared.
1—48" x 14' Fifield.
1—54" x 22' Worcester, Triple Geared.
1—58" x 18' 6" Dodge Lathe. Very Heavy.
1—60" x 26½' Thaver Houghton, triple geared.
1—60" x 24½' American, triple geared.
1—NEW 66" x 46 Putnam Triple Geared, Face Plate Drive, 5-step Cone; 6½" belt.
1—84" x 18' Special Boring Lathe.

LATHES—Turret.
2—21" Gisholt, 18" chuck, quick traverse, taper attachment.
2—24" Gisholt, taper attach.
5—2 x 24 Jones & Lamson.
4—3 x 36 Jones & Lamson, single pulley drive.
2—18" Libby, all equipment.
3—24" Libbey, Universal Facing Head, 3-jaw chuck.
18—6A Potter & Johnson.
1—NEW 3¼" x 40" Greenlee.
1—24" Brown & Sharpe Vertical, chucking mach.
1—24" Davis.
1—No. 24 New Britain, arranged for motor drive; almost new.

MILLING MACHINES—Knee Type, Universal.
1—No. 2 Kempsmith, Vertical Attachment.
1—No. 2 Kempsmith 13" Dividing Head.
5—NEW No. 1 Kempsmith.
1—No. 1½ Cincinnati.
1—NEW No. 2 Rockford High Power.
2—NEW No. 2 Garvin.
3—No. 2 Cincinnati.
1—NEW No. 2 Cincinnati.
1—No. 2 LeBlond.
2—NEW Kempsmith Universal.

MILLING MACHINES—Knee Type, Plain.
1—No. 0 Cincinnati.
4—NEW No. 1 Kempsmith.
5—NEW No. 1B Hendey, with dividing heads.
1—NEW No. 2 Rockford.
1—No. 2 Cincinnati.
1—NEW No. 2 Kempsmith.
1—NEW No. 3 Cincinnati, complete.
1—No. 3 LeBlond.
1—No. 3 Kempsmith.
1—No. 15 Garvin.
1—No. 5 Cincinnati, quick change, double back gear.

MILLING MACHINES—Thread.
4—Morris-Thompson, arranged for motor drive.
10—No. 3 Lees-Bradner.
5—No. 3C Lees-Bradner, for 9.2" English shells.
2—Archdale, Taft, Pierce, for 6" English shells.

MILLING MACHINES—Hand.
1—No. 1 Bickett.
3—NEW No. 2 Pratt & Whitney.
2—NEW No. 3 Garvin.
10—NEW Becker, table 20" x 5½".

MILLING MACHINES—Vertical.
1—Hilles & Jones heavy pattern, rotary table.
1—No. 2 Pratt & Whitney.
2—NEW No. 4B Becker.
1—Newton Vertical, Continuous, Motor Driven, for shell work.

MILLING MACHINES—Planer Type.
1—NEW 17" x 5' Eynon Planer Type.
1—19" x 8' Beaman & Smith; in fine condition.
1—22" x 22" x 5' Ingersoll.
1—24" x 24" x 12' Bement & Niles.
1—24" x 24" x 14' Bement.
1—30" x 30" x 8' Ingersoll, single spindle, motor driven.

MILLING MACHINES—Lincoln Type.
2—Briggs type, high duty.
3—New American, No. 1.
1—No. 7 Becker.
2—Pratt & Whitney.

PLANERS.
2—16" x 16" x 36" Pratt & Whitney Tool Room; almost new.
5—NEW 24" x 24" x 6' Powell, single head.
1—24" x 12' Detrich & Harvey, open side, one head, also milling attach.
1—26" x 26" x 10' Gray, one head.
1—NEW 30" x 8' Powell, 2 heads.
1—30" x 30" x 8' Ohio, late model.
1—30" x 30" x 8' Garvin, open side, fine condition.
1—32" x 32" x 16' Niles, 2 heads.
1—36" x 36" x 10' American; 2 Heads.
1—36" x 30" x 12' Detrich & Harvey, open side, 3 heads.
1—NEW 36" x 36" x 10' Wilson, 2 heads.
1—36" x 36" x 8' Gray; One Head.
1—36" x 36" x 14' Cincinnati, 2 heads.
1—42" x 36" x 14' American, 2 heads.
1—42" x 42" x 19' Powell, 2 heads.
1—48" x 48" x 10' Pond, 2 heads.
1—60" x 60" x 21' Pond; 3 Heads.
1—62" x 62" x 20' Canada Tool Works Planer: 2 Heads.

PUNCH AND SHEARS.
1—Waterbury-Farrell Alligator Shears, cap. 2½".
1—Cincinnati Gap Shears, 17" gap, 78" blade, ¼" capacity.
1—No. 411-G Toledo Squaring Shears, capacity 97", weight 12,600 lbs.
1—No. 2 Hilles & Jones Punch and Shear, 30" throat.
1—Cleveland Punching Shear, 36" throat, capacity 1" x ½".
1—Long & Allstatter, cap. ⅞ x ⅞.
1—Providence Steam-driven Punch, 48" throat, cap. 3" through 1½"; almost new.

SCREW MACHINES—Hand.
3—No. 0 Brown & Sharpe.
1—1" Pierce.
10—NEW No. 2 Owens Kent, wire feed, automatic chuck, 1 1/16" capacity.
4—20" Cincinnati Acme, friction geared head.

SCREW MACHINES—Automatic
2—NEW ⅝" Cleveland, Model A.
3—1¼" Cleveland, Model B, full auto.
1—NEW 1¼" Gridley Mult. Spindle, Belt Driven.
10—1¾" Gridley, mult. spindle; good as new.
5—2¼" Gridley, mult. spindle, arranged for motor drive.
20—3¼" Gridley, single spindle.
4—4¼" Gridley, single spindle.
2—No. 0 Brown & Sharpe.
1—No. 1 Brown & Sharpe.
1—No. 2 Brown & Sharpe.
3—No. 55 National Acme.
9—No. 56 National Acme, mult. spindle, 2¼" cap.
1—No. 515, 9-16" capacity, National Acme; late model.

SHAPERS.
1—NEW 16" Springfield.
1—16" Motor Driven Rockford.
1—NEW 18" Steptoe.
2—NEW 24" Milwaukee.
1—NEW 24" Potter & Johnson Universal.
1—NEW 24" High Duty Gould & Eberhardt.
1—NEW 24" Steptoe.
2—30" Morton Draw Cut.
5—NEW Barker 24".

SLOTTERS.
1—Wilmarth, 12" stroke.
1—New Haven, 10" stroke.

DOMINION MACHINERY CO. TORONTO

Some Tools of Particular Importance

2—Large Inclinable Presses, back-geared, 5" stroke, equal to new; weight 6,000 lbs.
1—Straight-side Press, geared, 5" stroke; 6,000 lbs.
1—190 Brown & Boggs Inclinable Press.
2—21" Hercules Rough Turning Lathes, suitable for 6" shells, oil pan and pump.
2—18" x 8' Engine Lathes, double back geared, quick-change.
1—13" x 5' New Champion Tool Room Lathe, with taper attachment.
1—16" x 6' Crawford Handy Type Tool Room Lathe, quick-change gear, taper attachment, oil pan and pump.
1—20" Back-geared Drill; nearly new.
1—14" New Sensitive Drill, tilting table.
1—14" Reid Drill, used.
1—16" Barker Cincinnati Shaper.
2—Heavy Duty Foote-Burt Drills, single pulley drive.
1—25 H.P. Motor, 25-cycle.
1—15 H.P. Motor, 25-cycle.
1—5 H.P. Motor, 25-cycle.

Every used tool fully guaranteed. We have a large stock, and we may have what you want. Why not inquire?

New and Used Machinery

ENGINE LATHES

1—No. 9 Ames Precision Bench Lathes.
1—13" x 5' Phil-Smith Standard Engine Lathe.
1—17" x 8' Lodge & Davis standard lathe.
1—16" x 6' Greaves-Klusman stand., comp. rest.
1—16" x 6' Hamilton, Style A, quick change, comp. rest.
2—18" x 8' Greaves-Klusman, quick change, double friction back gear, chuck fitted.
1—18" x 10' Lodge & Shipley, quick change, single back gear and chuck.
1—14" x 6' Champion, quick change, single back gear chuck.
1—22" x 8' Greaves-Klusman, stand. double friction back gear, comp. rest, chuck.
1—30" x 14' Lodge & Davis, stand., single back gear, comp. rest, chuck.
1—20" x 8' Fay & Scott, stand, turret on shear, turret tool post and chuck.

DRILL PRESSES

1—Henry & Wright four-spindle class A 7, ½" overhang.
1—Detroit five-spindle horizontal automatic Drilling Machine.
1—Baush multiple drilling machine, 12-spindle, 1½" diam. spindle, 48" round head.
1—Baush multiple drilling machine, 8-spindle, 30" round head.

PLANERS

1—24" x 24" x 6' Lodge & Davis, 1 head.
1—26" x 26" x 10' Gray, 1 head.
1—36" x 36" x 14' Cincinnati, 2 heads.
1—42" x 36" x 8' Lodge & Davis, 2 heads.
1—42" x 36" x 14' American, 2 heads.
1—24" x 24" x 6' Ohio.

TURRET LATHES AND SCREW MACHINES

1—No. 4 Warner & Swasey hand screw machine, power feed to turret.
2—24" Gisholt Turret Lathes.

MISCELLANEOUS

1—Knight No. 1 drill'g and milling machine.
1—Atkins No. 7 Kwik Kut power hack saw.
1—18" Smith & Silk geared rack shaper.
1—Challenge power hack saw.
1—No. 4 Canton portable floor crane.
1—Jib crane 8" x 8" x 15', with 12"x12"x19' boom.
1—No. 18 Lea-Simplex cold metal saw, capacity 7" round.
2—No. 6, 35" Fellows gear shapers.
10—Potter & Johnson No. 3 manufacturers' lathes, with pump.
1—Barret No. 2 horizontal boring machine, with 5" bar.
1—Newton double housing milling machine, 21" between housing, 6' table.

The E. A. Kinsey Company

Cincinnati, Ohio.

FOR SALE

1—90' Thomas Spacing Table complete with indicator carriage, trolley carriage, stands, adjustable roller, racks, etc. Capacity: Plates, 48' long x 48" wide; angles, 8' long x 8" wide. Further particulars on application.

1—40 H.P. Horizontal Gasoline Engine complete and in running order.

1—30 H.P. Horizontal Gasoline Engine complete and in running order.

1—Air Compressor driven by Twin Cylinder Fairbanks Gasoline Engine. (Mounted).

Complete equipment for machining 4.5 H.E. Shell Nose Plugs. Capacity, 10,000 per day.

1—Powerful Hand Punching Machine.

1—Horizontal Steam Pump.

(Get Bulletins with complete specifications)

NOT "SPECIAL PURPOSE" Machines, but regular style High Duty Lathes especially adapted for the purpose of finishing Shells or anything else you want a Lathe for, after you are all through with your Shell contract.

As Manufacturers of Lathes for a great many years, we can guarantee there is absolutely nothing better built in workmanship, power and convenience in handling, and they will be installed in your shop with that understanding.

Used by the prominent shops "over here" and "over there" who will have nothing but the best.

Send on to inspect—that is the way to tell

These High-grade "Used" Tools don't require Rebuilding

HORIZ. CYLINDER BORING MACHINE
(Like New)

No. 2 Barrett 5-in. Boring Bar, auto. feed in either direction 48 in., having capacity for boring and facing both ends of cylinder at the same time.
Bed 12 ft. 6 in. long; widened part 60 in. by 52 in.
Will bore, counterbore and face off both ends of 10-in. by 18-in. cylinder in one hour.

52-IN. "PLANER TYPE" SLAB MILLING MACHINE
(Good as New)

"Becker-Brainard" — capacity for handling work up to 52 in. wide, 26 in. high and Table 10 ft. in length inside pockets.
Housings, Heavy, Double Web Box form, and both are adjustable in and out to extreme width of 52 in.
Eight changes of feed, 20 changes of speed.
Complete with Oil-Pump, two Tanks and Oil Reservoir, arranged for Motor-drive, but no Motor included.

BIG "LANDIS" GRINDER

"Landis"—having capacity for handling work 12 in. x 66 in.—complete with full equipment—in thoroughly good condition.

POWERFUL TURRET LATHE
(Just as good as ever)

Especially desirable now that Upright Boring Mills with Turret heads are so scarce. This machine has 40 in, swing over bed and geared up to 96 to 1.
Main Turret 48 in. diam. carries 5 Tools and four Tools on Supplementary Turret, which has Power cross feed.
Handles between Chuck and Turret 6 ft. 9 in. Wide range of Speeds and Feeds. Wt. 22,500 lbs.

PLANERS

24 in. x 24 in. x 6 ft. American, 1 Hd.
26 in. x 26 in. x 8 ft. Pond, 1 Hd.

BORING AND TURNING LATHE

96 INCH SWING by 20 FOOT BED POND TURNING and BORING LATHE, face plate drive, compound rest power cross feed, 9′ 6″ between centers.

BORING MILLS

No. 2 Barrett Horizontal Cylinder, 5″ bar.
Betts Horizontal, 2¼″ bar.
20″ Bullard Vertical Turret Lathe.
18″ Bullard Vertical Turret Lathe.
Four 30″ Bullard Vertical, swivel turret head.
40″ Putnam Car Wheel.
Niles Car Wheel, 48″ diameter table.

RADIAL DRILLS

Two 5′ Prentice Bros. Plain.
4½′ Niles Universal.
4½′ Niles Semi-Universal.
4′ Niles Plain.
3½′ Prentice Plain, tapping attachment.
3½′ Hilbert Plain, tapping attachment.
3½′ Prentice Bros. Plain.
3½′ Gang Plain.
3′ Fosdick Plain.
2½′ Gardam Semi-Universal.

NEW SHAPERS.

Twelve 24″ Hollingworth Improved Triple Geared Crank.

PIPE MACHINES

16″ Saunders, 8″ to 16″ capacity.
10″ Cox, 2½″ to 10″ capacity.
8″ Saunders, 2″ to 8″ capacity.
8″ Eaton-Cole-Burnham, 2½″ to 8″ capacity.
6″ Stoever, 1¼″ to 6″ capacity.
Two 6″ Curtis & Curtis, 2½″ to 6″ capacity.
Two 4″ Morris 2½″ to 4″ capacity.
4″ Armstrong, 2″ to 4″ capacity.
2″ Borden, ½″ to 2″ capacity.
2″ Jarecke, ¾″ to 2″ capacity.

PUNCHES AND SHEARS

No. 3 Royersford double end Punch and Shear, 16″ throats, punch 1¼″ in 1″, architectural jaw.
No. 3A Royersford double end Punch and Shear, 10″ throats, punch 1″ through ⅞″.
No. 1 Royersford double end Punch and Shear, 7″ throats, punch ⅞″ in ⅝″.
Ridgway & Sons Alligator Shear, 15″ blades.
Pels Beam Shear "T-40."
Columbus single end Punch, 24″ throat, punch ¾″ in ¾″.
Newell Direct Acting Gap Punch, 53″ throat, punch ½″ through ⅛″.
Several NEW HAND POWER PUNCHES and SHEARS.
3″ Bethlehem Bolt Heading and Upsetting Machine.

MILLING MACHINES

36″ x 36″ x 12′ Ingersoll heavy duty Horizontal Slab, adjustable rail.
Beaman & Smith 2 spindle Vertical Slab, table 24″ x 48″.
Ingersoll Slab, 23″ between housings, table 20″ x 60″.
Two No. 5 Brown & Sharpe Vertical.
No. 22 Garvin Vertical.
No. 3 Cincinnati Plain.
No. 2 Cincinnati Universal.
No. 2 Cincinnati Plain.
No. 1½ American Improved Plain—December delivery.
No. 1 Bickford Plain.
No. 13 Garvin Plain.
Four No. 12 Brown & Sharpe Manufacturing.

HAMMERS

1600-lb. Bemet single leg Steam.
800-lb. Pratt & Whitney Board Drop Forging.
New 400-lb. Bement-Miles double frame Steam.
200-lb. Bradley Upright Cushioned Compact.
200-lb. Waterbury-Farral Foundry Plain Drop.
75-lb. Belden Strap.
60-lb. Bradley Cushioned Helve.
50-lb. Beaudry Power.
40-lb. Bradley Cushioned Helve.
Three 40-lb. Gould & Eberhardt Hand Rope Drop.

UPSETTING MACHINE—BENDING ROLLS

3″ Bethlehem Bolt Heading and Upsetting Machine.
No. 1 Hilles & Jones Straightening Rolls, 5′2″ between housings, ¾″ plate.
Niles Double Geared Bending Rolls, drop end housing, 40½″ between housings.
36″ Power Bending Rolls.
30″ Hand Straightening Rolls.
30″ Hand Bending Rolls.

PRESSES

No. 73½ Bliss Straight Sided Geared, 4″ stroke.
Five No. 114 Bliss Double Crank, 4″ stroke.
P-4 Ferracute Punch Press, 3″ stroke.
Bliss Geared Punch Press, 2″ stroke.
No. 4 Toledo Inclinable Punch Press, 1½″ stroke.
No. 20 Bliss Inclinable, 2″ stroke.
No. 18 Inclinable, 1½″ stroke.
No. 3 Bliss Geared, 1½″ stroke.
No. 3 Farrel Power, 1½″ stroke.
No. 4 Farrel Punch Press 1½″ stroke.
No. 2B Brown, 1¼″ stroke.
Sanborn & Sons Double Crank Die and Cutting Press, 3″ stroke.

HYDRAULIC PRESSES

350-ton Hoe & Co. Vertical, with pump, will take 34″ x 31″ between rods.
200-ton Sellers Hydraulic Wheel Press, 6′4″ between bars, pump.
100-ton Shaffer Hydraulic Wheel Press, pump, motor.

GEAR CUTTERS

Three Newton Automatic Gear and Hopper.
36″ Brown & Sharpe Automatic Hob and Spur.
24″ Brainard Automatic Spur.
24″ Brown & Sharpe Automatic Spiral, right and left hand.
24″ Gould & Eberhardt Spur and Bevel.
18″ Becker-Brainard Automatic Spur.
19″ x 5″ Lees-Grant Automatic.
Two No. 12 Brown & Sharpe Automatic.

MISCELLANEOUS

24″ Baker Bros.
24″ Morton.
No. 2 Davis.
7″ Mitts & Merrill.
3½ Acme Bolt Cutter.
9″ Bement double end Cut-off Machine.
48″ x 16′ Niles Tire Wheel Lathe, face plate drive, triple geared.
36″ x 18′ Farrell Engine Lathe, face plate drive.
32″ x 22′ Gleason double back geared Engine Lathe, raising blocks to 66″.
28″ x 10′ Niles Engine Lathe, taper attachment.
26″ x 14′ Putnam Engine Lathe.
24″ x 24′ Fitchburg Engine Lathe, raising blocks to 30″.
2¼″ x 24″ Jones & Lamson Flat Turret Lathe, sliding head.
2″ x 24″ Jones & Lamson cone head Flat Turret Lathe.
21″ Gisholt Turret Lathe.
18″ Gisholt Turret Lathe.

HAMILTON - ONTARIO

THESE illustrations show our Factory Building, and give some idea of the up-to-date manner in which it is equipped.

THE New Addition recently completed is a one story Building of Brick and Mill Construction, 52' x 85', provision being made for an additional story being added at any time. The roof was made especially rigid and strong to take care of overhead machinery, so that there would be the minimum of vibration.

The lighting is excellent, in that the maximum amount of natural lighting is procured by large steel sash and skylights. The artificial lighting has been carefully and successfully worked out. The floor is finished in hardwood, the wood sleepers being well bedded in a heavy under floor of concrete.

The new addition is joined directly to old work by taking out the adjoining walls entirely, making the entire first floor one. The equipment is of the finest and especially selected for the production of the most accurate work.

Cataract Precision Bench Lathes and Attachments

Are doing Remarkable Work in a Number of Canadian Factories Where Their Splendid Qualities are Proved and Appreciated

Coming down to facts, what do you think of this machine?

What do you think of the base, the circular bed, the sliding tool post, the strength suggested in that massive headstock, the range of gears, the special tailstock, and the arrangement of those gears? We think you will do as a great many other Canadian firms have done, write for our catalogue which gives the specifications, descriptions, etc.

"Write now."

If You are in the Market for 100% Efficiency Lathes

Write Us.

Efficiency is synonymous with the name of Hardinge. The pioneering days, spent in experimenting, have resulted in the finished product and right proud we are of it, too. Its quality is of the best, its price is most reasonable, its efficiency is beyond expectations. Do you know of any equipment with a Hardinge Lathe? What do they think of it? When you find out write for our Catalog, which will give you a complete line on our products. Get in touch with us.

Catalog No. 15 is ready to mail today. You should write "right" now.

M. E. C.

Master Hinge Collet Chuck and Air Cylinder

Ready for Making Shells for the Allied Governments

M.E.C. Air Equipment is satisfactorily filling the requirements of makers of shells for the U.S. and Allied Governments because of its superior design and its ability to increase production from 25 to 40% over any other method now employed.

M.E.C. Equipment being operated by air holds the piece being chucked absolutely rigid as the use of air assures constant pressure on the work.

M.E.C. Air Cylinder is the essence of simplicity—no 20 or 30 screws to take out to adjust packing—no danger of head blowing out due to poor construction—it is made to withstand severe service.

There are as many as 250 M.E.C. Air Equipments in a single installation.

Write for literature.

M. E. C.
Air-Operated Expanding Mandrels

The above picture shows part of a shipment of M.E.C. Mandrels to makers of shells for the Allied Governments.

These mandrels have proven highly efficient in munition plants, as our many big orders and repeat orders prove.

The M. E. C. Mandrel shown above is particularly adapted for rough and finish turning—compensating mandrel furnished for cutting rough shell forgings to length and for centering.

Write for information on all M. E. C. equipment.

The "Trackless Trains" Method

SAVES MEN—SPEEDS UP PRODUCTION—LOWERS COST

What are you doing to solve the labor problems? If you cannot get men, you must substitute with machines wherever possible.

Records show that a MERCURY TRACTOR replaces from 6 to 10 men, and operates at an expense equivalent to the daily wage of one man.

These tractors will utilize your present trucks as trailers, and silently and efficiently guide them in and out of narrow aisles and around sharp corners.

Write to-day for "Methods and Means," the new book on the "TRACKLESS TRAIN" method of material movement.

Two Type "A" Galt Sprinkler Stokers applied to 150 H.P. Return Tubular Boiler. (Coal Hoppers immediately removable.)

GALT SPRINKLER STOKER

Effects a saving in coal from 10% to 20%.
Effects a saving in labor from 25% to 50%.
Gives a brilliant, thin, perfectly level fire.
Gives smokeless combustion.
Increases the boiler capacity.
Increases the percentage of the CO.
Burns the fuel completely to the finest ash.
Operates for years without need of repairs.

The **Galt Sprinkler Stoker** automatically feeds and uniformly spreads the fuel to the furnace in a light, continuous stream, and gives a perfectly level fire, 3 to 4 inches thick.

Operates with natural, forced, induced or any kind of draft.

Burns any kind of fuel, anthracite, bituminous or lignite.

Its ability to save fuel commands your particular attention in this period of increasing coal prices.

Its labor-saving virtues make a strong appeal in view of the scarcity of labor.

And its cost-cutting capacity in general deserves your immediate attention with the ever-increasing cost of production—for the **Galt Sprinkler Stoker** will make a saving in your plant that will prove worth while.

Galt Sprinkler Stokers fill every practical requirement of a mechanical stoker.

Let us tell you more about it. Write.

WE SUPPLY POWER-TURBO BLOWERS, McNAUGHTON ROCKING GRATES, DAMPER REGULATORS AND OTHER POWER PLANT EQUIPMENT. Send for illustrated catalog.

See the Sprinkler in action! Note how logically it operates!

"Canadian" Rivet Forge No. 625

This is one of the most substantial forges built.

It has a strongly ribbed steel plate fire pan mounted in four securely braced steel pipe legs.

Blast is provided by means of the well known "Canadian" No. 200 Ball Bearing Silent Blower. This blower has helical cut gears and steel pinion. High speed pinion is mounted in high grade radial bearings.

"Canadian" 20" Upright Drill

Was designed and built to meet the demand for a moderate priced drill capable of doing accurate high grade work.

It can be changed instantly from plain drive to back geared drive.

All parts are carefully made and accurately fitted. All gears are machine cut and the crown gear runs in bronze bushing. Automatic feed stop; split adjustable bearings; worm feed wheel; table and base slotted and planed.

"Canadian" Stationary Forge

Built entirely of cast iron and is designed for the heaviest work.

Provided with "Canadian" patent Down Draft hood. This hood is adjustable by means of a lever to any position.

This insures a pure atmosphere all the time. All operating handles are conveniently located.

"Canadian" Universal Punch and Shear No. 25

A heavy duty machine designed to handle three kinds of work at one time. Cutting angles, squares, flats, rounds and all structural shops. Slits plates, punches angles, sheets, beams and channels. Mitres angles, right or left, up to 45°.

Built of "Armor Plate" steel—tensile strength 75,000 lbs. per sq. in., and only one-third as heavy as cast iron.

We'll be glad to send literature. **Write Dept. 16.**

"BEATTY"

Auxiliary Ship Machinery. Cargo Winches. Warping Winches. Anchor Windlasses. Ash Hoists, Etc.

7 x 12 Double Cylinder, Single Drum, Link Motion, Two-speed Cargo Winch, with Two Whipping and Two Warping Ends, of the type we are building for a number of ships now under construction in Canada. Either Double Helical Tooth or Spur Gearing throughout.

4 x 4 Double Cylinder, Single Drum, Throttle Reverse Ash Hoist, as supplied Messrs. John Inglis & Son, John Coughlan & Son, The Welland Shipbuilding Co., and others. Variations of the above machine can be furnished to your order. All built to jigs, thus insuring interchangeability of parts. Let us have your inquiries for this class of equipment. We'll quote promptly.

M. BEATTY & SONS, Limited, Welland, Canada

If interested, tear out this page and keep with letters to be answered.

Class "EL-2" Power Driven, Two Stage, Straight Line Air Compressor, with Intercooler and Unloader.

Power-Driven Air Compressors

We manufacture these machines in either one or two stage, straight line or duplex types. All have leaf valves and flood lubrication, and are particularly noticeable for their simplicity and compactness, combined with easy accessibility to all parts. These points are very evident in the machine illustrated. The water-jacketing is unusually thorough and the intercooler surface is liberal, resulting in superior economy at all loads.

Our short-belt arrangement for driving these machines is the most economical where space is limited.

Steam-Driven Air Compressors

These machines are manufactured in straight line and duplex styles, and either single or two-stage. Duplex machines may have the steam cylinders compounded and fitted with adjustable cut-off valve gear when desired.

Practically all of our steam-driven machines may be converted to belt drive and back again to steam drive when necessary, and while in place. This is due to the location of the steam cylinders and is a point of convenience peculiar to our line of steam-driven compressors.

Class "RL-3" Duplex Steam Driven Air Compressor, Compound Steam and Air Cylinders. Meyer Adjustable Cut-off.

We are also manufacturers of Air Hoists, both Direct Lift and Motor styles; Air Lift Pumping Systems; Coal Cutting Machines; Drills for Rock, both Piston and Hammer types; "Little David" Pneumatic Tools, including Riveters, Chippers, Drills, Grinders, Reamers, etc.; Pumps, Steam and Centrifugal; Tie Tampers; Sand Rammers; Air Power Equipment of all kinds.

The High-Speed Riveting Hammer Guaranteed to Save 15 to 20%

on any class of riveting work — the most intricate flush riveting, filling of countersinks, etc., not excepted.

The High-Speed, Heavy-Duty Riveting Hammer forms heads any shape desired, and polishes head at the same time.

Women or boys can operate as well as men.

Two heavy rubber bumpers in rear of machine, another bumper between the hammer head and helve, deliver a succession of rapid, elastic blows, and hickory helve absorbs the shock of the rebound.

Drive is side friction at any speed up to 1,700 strokes per minute. It enables operator to strike a very sensitive or heavy blow at will, which is impossible with a clutch drive machine.

Service life of the High-Speed Riveting Hammer runs into many years. Bushings of phosphor bronze are used throughout.

Send us a few of your parts; we'll return them **properly** riveted.

Ball Bearing Model E Drill Press

has demonstrated extraordinary ability on work from the smallest to a 3/16" hole.

Main spindle is heat treated, ground to size, and guided through a bronze quill with support at each end in an annular ball-bearing.

2,100 and 6,000 R.P.M. are the standard spindle speeds. Special pulleys increase the speed to 10,000 R.P.M.

If your work demands extreme accuracy; if your output must be increased, it is to your interest to investigate this Drill.

FLINT SHOT
is relatively Dustless

THE clean white hardness of FLINT SHOT (a manufactured product) is of great value in enabling the operator to *see what he is doing!* This applies equally to "cabinet" sand-blasting, in which the man is outside, and to sand-blasting in an enclosed room. In the latter case, the cleanness of FLINT SHOT has a vital man-saving angle.

This same hardness also means that one carload of FLINT SHOT goes as far as two or three cars of natural sand. Think what that means, in these days of car shortage!

Send for our Book on Sand Blasting—also ask for an envelope sample of FLINT SHOT so you can compare it with ordinary sand.

Short of Help?

This Truck will Help You Out!

Universal Ball Bearing Elevating Truck

One man with this Universal Truck can do the work of a number of men with a number of trucks. It offers you a practical means of combating the labor shortage problem. It points a way to easy, quicker and safer trucking in all parts of your plant.

The Universal Elevating Truck is simple to operate. All material is stacked on the platforms. To move material the truck is backed under the platform, the handle of the truck is then pushed down, keeping the button depressed, which raises the truck bed, and with it the loaded platform, at the same time automatically locking it in its raised position.

When hauled to the desired position the button is pressed and the handle raised, lowering the platform to the floor. The truck is then drawn from underneath and is ready to move another platform.

Raising and lowering of the truck can be operated with one hand—can be raised or lowered at any angle.

Specially designed Chapman Ball Bearings are used on the Universal Truck. This assures the highest efficiency in a vital part and lends ease and convenience in its operation.

Send for literature telling all about the truck and its cost-cutting uses.

Because War Demands Urge Utmost Output

HANNIFIN Air Equipment is taking the place of slow hand-and-wrench methods in hundreds of plants, the change to Hannifin increasing output from 20 to 100 per cent. And that is not all. Seven times in ten Hannifin Air Chucks and Mandrels are operated by men and boys new to machine shop work—and often by women.

So long as there is labor—male or female—capable of simply turning the Hannifin air control lever, Hannifin Air Equipment will enable you to meet the demands of war on a 100 per cent. efficiency basis.

To prove the altogether superior features of Hannifin Air Equipment, *we ship on trial.* And if you find a Hannifin Air Chuck is not all we claim—almost instantaneous in action, rigidly gripping, never slipping—please send it back.

Write now for catalog.

The MUELLER
Heavy Duty Engine Lathe

If ever any machine deserved the name "Ever-ready" it is the Mueller Heavy Duty Lathe.

For light or heavy cuts, at high speed or low; from hogging off stock to the chasing of a fine thread, the Mueller is the one lathe for fast, accurate and economical operation. And it's not a "job" to set it for different work; there are no special attachments. The changes in the gear box itself provide for forty-five threads. Eighteen spindle speeds are under the control of a lever on the front of the machine. Complete description will show you the many other advantages. Ask for it.

The Mueller Radial

Popular
Because
Profitable

THE special features of the Mueller Radial were not designed to add grace and beauty to the machine, but to equip it for accurate drilling at high speeds—to prepare it to meet the requirements of modern manufacturing—to make it, in short, a profitable investment to the purchaser.

The column is cast in one piece—to which four internal webs add extra reinforcement; the arm has wide bearings on column, swings 360 degrees, clamps rigidly at any point and is so well balanced that accuracy is assured even at the top of the column and when drilling at the extreme traverse of the spindle.

Simple and centrally located controls, automatic trip for feeds and speeds and other well-designed and durably constructed features make for profitable drilling on the popular

BRIGGS MILLER

THE TOOL FOR ALL 'ROUND WORK

THE "Briggs" is *different* because it represents a radical departure from the conventional type of milling machine. It's *superior* because it represents the successful result of painstaking efforts to meet a widespread demand for a machine that would turn out work *more economically*. But not only has it succeeded in cost-cutting—it is doing *better work*, too.

Rigid, powerful and easy to operate—these are outstanding features. Takes wide, deep cut without showing least sign of distress.

This is the Miller you have been thinking about. Get the full details of its excellent construction.

Oxy-Acetylene Welding and Cutting

Investigate the Money-saving Advantages of This Process

Oxy - Acetylene Welding Outfit Employing Prest-O-Lite ready-made Acetylene and compressed Oxygen, both in portable cylinders.

There is practically no line of metal manufacturing or repairing in which oxy-acetylene welding has not already established itself firmly as standard, routine method.

All kinds of metals are welded by the Prest-O-Lite process of oxy-acetylene welding. Valuable castings, and broken machinery parts worth thousands of dollars, are saved and quickly put back into service.

Through avoiding costly tie-ups and delays in production caused by the breakdown of an important machine—or by saving the cost of a new part—one Prest-O-Lite welding repair may save the cost of the entire welding outfit many times over.

If you are interested in making your plant more profitable—in reducing operating costs and effecting many economies in production—if you wish to make your product stronger, neater, better—investigate what Prest-O-Lite Welding will accomplish for you.

Prest-O-Lite PROCESS

employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones. Provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Apparatus consists of an equal pressure blow pipe, automatic regulators and gauges, and all necessary equipment. Adaptable for oxy-acetylene cutting by the addition of special cutting blow pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the welding process quickly and easily.

We will gladly send illustrated literature and interesting data showing actual instances of sanvigs made by others. It may suggest valuable ideas to you. Write for it.

THE DENNIS WIRE AND IRON WORKS CO. LIMITED
LONDON CANADA

Trahern Rotary Geared Pumps are used on this Gisholt Turret Lathe

BECAUSE the manufacturer knows that every unit of service must of necessity be of the same value as every other unit, and this is only possible when the accessories with which the machine is equipped measure up to the same relative standard. Our Pumps Do.

TRAHERN PUMPS will not clog or lose their prime. You can operate them at slow speed and obtain desired capacity; this conserves wearing qualities. Will work with or without pressure, performing the functions of two types of pumps. With TRAHERN positive drive you can shoot lubricant into deep bores or other work difficult to cool. This is not possible with a centrifugal pump.

It required sound, practical reasons to convince such concerns as the AMERICAN TOOL WORKS CO., GLEASON WORKS, PUTNAM MACHINE CO., and scores of others that TRAHERN PUMPS possessed numerous points of superiority. We are anxious to demonstrate to you also the truth of our statements.

Send us your address and we will forward sample pump, free of charge, which will verify all that we say regarding our product.

SHOP ROOM

Labor and Production are the Main Factors Nowadays

Wouldn't a proposition interest you that would solve these problems? We have proven to hundreds of others that our New Improved Peerless High Speed Heavy Duty Metal Cutting Saw will do more work with less labor and save floor space. Instead of using several machines, one Peerless will do the work.

You are losing money in delaying your production and tying up ready cash when building.

Now can you afford to pass up this proposition? You take no chances, we allow you thirty days' free trial before you decide to purchase. No previous records or world-wide reputations are given consideration after this tool is once installed.

It takes but a moment for any manufacturer to realize the real value of this tool after a comparative trial. Many find them so profitable that they are ordering additional machines by express.

It will surprise you to note the large list of users. May we send you a copy?

PEERLESS MACHINE CO. 1607 Racine St. RACINE, WIS., U.S.A.

Circulating Pumps

Eliminate the separate relief valve and its necessary piping by installing the Roper Circulating Oil Pump. But, you say, why install a new system when the present is good enough? This "good enough" article may appear to be giving satisfaction, *but,* is it giving the best to be obtained. Can you speed up without any fear? With a Roper you need not have any fear of any kind. The oil flows from it in a steady, even stream, and there you can speed up to full capacity and let her go feeling confident.

Inquire. You will get valuable information anyway.

R-S TOOLS

Bench Tapper

TAPPING MACHINES

Faster tapping and quicker assembling — these are claims we make and claims we are prepared to prove for R-S Tapping Machines.

Column Type Horizontal Tapper

HERE'S THE PROOF—friction drive, absorbing all the shock, allows a chuck speed of 140 r.p.m. on ⅝-in. work—50% faster than the usual tapping speed for that size. Uses but 1 h.p.

The smoother drive also reduces the strain on the taps. They wear longer —fewer delays from taps breaking in the work.

For assembling threaded parts (valve stems, spark plugs, instruments, couplings), R-S Tappers result in quicker assembling and a decidedly larger output from every operator.

R-S OIL FEEDER

The ⅝" Tapper is featured by the continuous oil feed which allows greater speed, increased efficiency and output and longer life.

All enquiries quickly attended to.

R-S TOOLS

AUTOMATIC DIE HEADS

This R-S Tool, with its new construction (in which are embodied several practical improvements) offers you **more efficient** and **more economical** service than is possible with any other automatic die head.

The hardened and ground guides for the chaser is something new and better. Further, it has a positive opening and closing cam action. The chasers have the necessary radial movement to enable the die to open after the threading operation has been completed. They are supported by a cam ring throughout their entire length and width.

The chasers slide between hardened and ground guides, and are supported by carriers which have a groove in the outer end for the positive opening cam.

This cam, the locking pins, and the "float" have features that add to the distinctiveness of this "Boehm" Tool.

Built in sizes to cut from 3/8 to 9" diameter, or larger if so ordered, and with taper attachment and roughing and finishing attachment.

A Cost-Cutting Shell Worker

THE

Pringle

Flexib e Shaft Shell Cleaner and Γ tifier

Effectively cleans the interior wall or base of any size shell and retouches the rough spots; quickly goes through a pile of work.

For Light Retouching and Reclaiming Defective Shells.

The "Pringle" has a wide scope. For light grinding, polishing and drilling—as well as shell cleaning—it can't be beaten.

The "Pringle" is a favorite in Munition plants, and is used with unequalled success in ordinary manufacturing.

Freely flexible to a certain radius, where it automatically forms a stop, it positively prevents accidental short bends.

Three-speed countershaft and belts prevent overloading of the motor.

Simply remove the detachable spindle and wheel, and drill chuck can be attached quickly and easily for drilling or grinding.

3402 Osler Ave., VANCOUVER, B.C.

Every Thread is Straight, Even and Accurate

The Chasers in an *H & G Automatic, Self-Opening Die Head* are set and held in place by a steel cam. That cam once adjusted, locks; there is no stoppage or changing in size.

The quick release not only issues the cutting of the thread to a given point every time, but permits cutting right up to a shoulder when required.

Simple, Strong and Compact.

Our booklet tells more. ***Drop a card for it.***

VICTOR Collapsible TAP

A Difficult Job made Easy

Tapping base of 8" shells on a drill press with Victor Collapsing Tap.

This photograph was taken in a large shell factory in Canada.

Adaptable for any size shell from 75 mm. up.

THESE TAPS are strong and durable and are made from the best materials obtainable. The bodies are machine steel, and the chasers best grade high-speed steel. Simple in construction, and taps are easy to set; screw adjustment from the front end maintains close accuracy; automatic trip reset by lever; adjustment at rear end regulates spring tension. Sizes 1 to 12 inches, any pitches. By adjustment they can be made to cut standard, large or small threads.

The very tool you need for that hard shell work. Used by many large shell manufacturers.

Send blue prints for estimate on Victor Equipment.

Little Giant

Screw Plates

There is a Little Giant Screw Plate for every possible need for mechanics, plumbers, blacksmith shops, garages, automobile owners, steamfitters, electrical conduit workers, ranches, mines, etc.

All Little Giant Screw Plates are furnished with Little Giant Dies. These have recently been improved by the application of a new idea.

Both sides of the die are bevelled so that the die may be reversed and the screw cut from either the face side or through the guide. Little Giant Dies are adjustable by means of set screws at the end of each half, and once adjusted and the guide screwed on, they are held in the collet as tightly as a solid piece.

There's a Winfield Welder For Your Shop

THERE is, and probably it is not a special machine either. In addition to being made in a wide range of sizes and designs, Winfield's Welders are most unique in their adaptability to different classes of work.

We have striven to make the "Winfield Way" an economical way. The salient features of the Winfield have been standardized to such an extent that it is possible in most cases to instal a stock welder that can be kept busy *every minute of the day.*

We have a welder for every conceivable sort of metal spot or butt welding. For this reason Winfield Welders are making good in the small shops, where the work is varied, as well as in large shops where there is more duplication.

Winfield Welders represent efficient spot-welding reduced to its simplest terms. Their operation and adjustment are simple—unskilled operators require little time to become expert. They consume very little power. The patented water-cooled electrode points last eight to ten times longer than non-cooled points and give neater welds during their life.

Have our advisory department send samples of welding as applied to your requirements, with data, re costs and time. Or—ask for "Electric Welding by the Winfield Way," an interesting booklet.

The Winfield Electric Welding Machine Co.

WARREN, OHIO.

Canadian Office: 317 St. James Street, Montreal, Que.

S-24H. Sliding Horn Spot Welder. Horn at Top of Slide

B-110. No. 42. Butt Welder.

S-12M. Sliding Horn Spot Welder.

It turns poor heating systems into the most efficient. It costs you nothing because it saves more than its cost in fuel.

Morehead
Back to Boiler
SYSTEM

Hundreds of steam users have profited by reading the Morehead Book and taking advantage of our Free Consultation Service. It will pay you to investigate.

IN THE STUDEBAKER PLANTS

December 13, 1909, in their plant at Port Huron, Michigan, the Studebaker Corporation installed their first MOREHEAD BACK TO BOILER SYSTEM.
To-day, throughout their seven big plants a total of 15 **Morehead Traps** drain the exhaust steam heating systems, live steam heating systems, high pressure steam mains, heaters for forced heat circulation systems, dry boilers and enamelling ovens. Their last order, representing the **ninth repeat order,** was placed with us on April 25, 1912, for Plant No. 3 at Detroit.

Solely because widely known is the Studebaker Corporation singled out for mention. In hundreds of other plants the MOREHEAD BACK TO BOILER SYSTEM is giving equal satisfaction.

Canadian Morehead Manufacturing Co.
WOODSTOCK CANADA

"We were able to cut out one of our boilers—saving fuel and getting better results," wrote an executive of the Fenton Fibre Box Co., of N. Tonawanda, N.Y., following an installation of the MOREHEAD BACK TO BOILER SYSTEM in their factory.

PROMPT DELIVERIES

THE GRAY MFG. & MACHINE CO., LIMITED
686-692 St. Clarens Avenue TORONTO, CANADA

A Highly Developed Machine forShell Work

These machines have been developed for and are extensively used by munitions manufacturers. Both have demonstrated their efficiency and economy.

Gray's Shell Blast for Cleaning Inside of Shells

Gray's Shell Blast

quickly and thoroughly removes all scale or signs of boring tool marks from the inside of nosed-in shells. Operation is as simple as it is fast—two levers control the mechanism—shot is automatically drawn into the air line from the hopper—shell is rotated slowly a few times and the job is done.

Machine takes 4.5, 5- and 6-inch shells and can be arranged to handle other sizes. We'll be glad to quote production figures, prices, etc.

Heavy Duty Boring Mill

Horizontal Type—6-in. Bar

To fill the insistent demand we are commencing the manufacture of a heavy duty Horizontal Boring Mill. This machine is specially designed for heavy manufacturing work, such as gun mounts, etc.

A Good Way to Start the New Year

Resolve to Eliminate Cleaning Troubles and Cut Cleaning Costs by using

OAKITE

Whether it's Munitions, Machinery or Ships you're supplying, OAKITE will make your task easier, your deliveries quicker, your cleaning worries fewer and your finished product better.

OAKITE cleans faster and surer than the old-timers,—it's full of speed and gets to work right off. It is every ounce a cleaner—does not contain a filler. It dissolves completely, rinses easily and does not leave a sediment or scum in the tank.

The workmen in your plant will like OAKITE, because it will not burn their hands or clothing. It is not inflammable, will not explode and has no fumes.

We want every manufacturer in Canada who is in need of a reliable, safe and highly efficient cleaner, to see OAKITE work in his own plant.

Our Service Department now extends into Canada, and whenever you say so, we will send an expert thoroughly versed in cleaning methods to demonstrate OAKITE for you. Ask for a trial! It in no way obligates you.

They Depend on the Men in the Shops

You may discern no relationship between what is done every day in your shop and the military task of defeating the Huns, but the task is there nevertheless. And this task in the shops is best fulfilled by tools bearing the efficient and labor-saving merit such as JACOBS' IMPROVED DRILL CHUCKS.

It has been demonstrated by thousands of Drill Chuck users all over the world, that the Jacobs Improved Drill Chuck embodies CONVENIENCE, EFFICIENCY, ACCURACY and DURABILITY. Jacobs Chucks help a whole lot in maintaining and increasing output—their steady, sturdy hold on drills gives true, well-finished holes and prevent loss of time removing broken drills.

Put them to the test and note the difference in your output.

The Jacobs Mfg. Co., Hartford, Conn.

They Depend upon the Tools they Use

It is upon the army of toilers in the industrial plants of the Allies that the striking power of their armies on the battlefields of Europe must depend.

Every means to speed-up and economize in production must be brought into play.

Jacobs Chucks answer one need of the day. They not only protect your drills from breakage through bad aligning and sudden strains, but keep your drill shanks in good condition. Where you find drills well taken care of by the chuck used, you also find the **greatest record of ouput**, and invariably you find Jacobs Chucks.

The Jacobs Mfg. Co.

Hartford, Conn.

Independent FOX Drill Speeds

TRADE MARK

Simplicity

The increase of both material and labor has demanded the construction of machines with the minimum of parts essential to intensive production required to-day. This **New Type** Multiple Spindle Drilling Machine embodies features which highly recommend it to all classes of drilling operations.

Strength

Production work to-day places severe strains on Drilling Machines. Each part in this FOX MULTIPLE has been given the greatest strength which design and material can impart, the result being a machine which will stand up on the most severe work.

Independent Drill Speeds

Many classes of work have large and small size holes which should be drilled simultaneously, each drill can be driven at approximately the correct peripheral speed. Fox Independent Drill Speeds are obtained by using gears having the same strength as those used when one speed only is provided for each spindle. Each spindle can be placed in a neutral position when not needed in drilling.

Spindle Construction

The Fox three-piece universal joints have all friction surfaces hardened, and eliminate all screws, pins and rivets.

We have adopted a design of spindle in which each part is constructed to give the maximum durability and strength.

We have the machines specially adapted to meet your needs. Write to-day giving full particulars of your work.

MASTER OF ALL MILLING THE ROCKFORD

Our patented support bolts on to this flange on column, affording great stiffness and rigidity; minimizing vibration and materially increasing cutting capacity.

Big Cuts at unusual speed and enduring accuracy are given you in this Rockford Universal Milling Machine. Note that illustrations attempt to show its extreme rigidity.

But it is its great surplus power over the mightiest demands that makes it master of every milling job and master, too, of 99 out of every 100 other millers in the matter of production ability.

Note the heavy column with gear train operating from rear end of spindle to drive attachments, leaving spindle nose free for use as desired. A convenient arrangement.

Arrangement of back gears inside the column, at the front, brings them so closely together that chatter is prevented and more than enough power is generated to take the heaviest strains without taxing the great srength of this Rockford Milling Machine.

Other details you could know with profit.

WRITE TO-DAY.

Compressors

The illustrations shown here will convey a comprehensive idea of the sizes, adaptability and range of the Jenckes Compressors. The care and mathematical exactness that characterize all our work is embodied into the construction of our compressors.

They are used

throughout North America, giving that sure, efficient service that can only be given by quality machines. Exactness of detail and finish are two features that are worthy of careful scrutiny.

Inquire of us

for full particulars, prices and shipments. We are always ready to give you the best of service, attention and information.

From the Name

ROCKFORD

to the Drilled Hole—

POWER

This Heavy Duty Rockford Box Column Drilling Machine will maintain maximum speed drilling holes to 2½-inch diameter in solid steel.

No stock is tough enough to slow its speed or swerve the cutting drill from true alignment.

It will bore up to 6 inches in both cast iron and steel.

Equipped with phosphor bronze bushings; automatic trip; three simple combination drives; and high carbon forged steel spindle. Nose is bored for No. 5 Morse taper slotted across the head for driving heavy boring and facing heads.

Say you want all particulars.

Woodworking Machinery

Quick and Efficient Service to Shops of Western Canada

There are distinct advantages gained by Western Canada shops in dealing with us.

We are the largest sellers of Woodworking Machinery in the West and we represent the foremost Canadian and American manufacturers. We give quick service, save you heavy freight charges and supply you with the best of Machinery.

602 Main St. Winnipeg

FOR PIPE OR NUT HARD TO REACH WITHOUT IT

Easily opened or closed to a slipless grip by the thumb of the hand that operates it, this B. & C. "S" Wrench is specially designed for pipe and nut work otherwise hard to reach.

Sliding jaw is a steel drop forging; operating nut is steel, and all parts are interchangeable. Ask for Catalog of B. & C. made-right wrenches.

Proposals and Estimates covering complete plants or separate units, required for export will be furnished on request.

FREDERICK S. BLACKALL, Woolworth Tower, New York, U.S.A.

Taft-Peirce is particularly qualified to assist in Aeronautical Development Work

The Taft-Peirce Company is one of the oldest and the most extensive "contract-shops" in the United States. It has been identified with the evolution and initial production of many mechanical developments, each marking a new era in the sphere of human progress—such as the sewing machine, the type-setting machine, the typewriter, the adding machine, the motorcycle and the automobile.

To-day it is the largest and best equipped organization of its class in the country for work of the character necessary in the development of aeronautical engines, light machinery parts and special tools.

The advantage of such experience is at the command of concerns whose present production might be materially improved or increased by proper co-ordination.

Canadian Machinery BUYERS DIRECTORY

If what you want is not here, write us, and we will tell you where to get it. Let us suggest that you consult also the advertisers' index facing the inside back cover, after having secured advertisers' names from this directory. The information you desire may be found in the advertising pages. This department is maintained for the benefit and convenience of our readers. The insertion of our advertisers' names under proper headings is gladly undertaken, but does not become part of an advertising contract.

BOILERS

2—300 H.P. B. & W. Water Tube Boilers, with superheater.
1—100 H.P. Frost Tubular Boiler, 66 x 16, 125 lbs., suspended type, full front.

ALL GOOD AS NEW.

TANKS AND VATS

1—Vertical Steel Tank, 80" x 30", ¼ to ⅜" plate with manhole on side. Used as water still; has worm in barrel.
12—Beer Vats—12 ft. deep, 9' 6" diam. at bottom and 8' 9" at top, covered 2½" oak staves, 12 steel banks 4½" x ¼", manhole on side, all equipped with stands, thermometer, drain pipes, 160 bbls. cap.
2—Steel Tanks, 9' 6" high, 6' diam., 3-16" steel, varnished inside.
1—Vertical Steel Tank, 30" diam., 78" high, ⅜" steel with manhole.
1—Horizontal Steel Tank, 54" diam., 14' long, ⅜" plate with 60" gauge glass; made from boiler shell, holes blanked.
1—Vertical Galv. Iron Tank, 78" high, 36" dia.
1—Horizontal Steel Tank, 60" diam., ¼" shell 10' long.
1—Vertical Steel Tank, 78" high, 30" diam., ¼" steel with dished heads, legs and 1 manhole.
1—Vertical Steel Tank, 5' high, 30" diam., ¼" steel, with dished heads, legs, and 1 manhole.
1—Steel Tank, 8' diam., 8' deep, flat bottom, cone top.
1—Horizontal Steel Tank, Mash Tub, 54" deep, 108" diam., ¼" steel.
1—Rectangular Steel Tank, 6' deep, 6' long, 3' wide, with coil in bottom, no top, ¼" steel.
2—Steel Tanks, 15' 6" long by 8' 0", diam., ¼" shell, ½" ends, cap. 5,500 gals.

Write or wire for any new or second-hand machinery.

Theodore Kipp Co., Ltd.
WINNIPEG

PRODUCT

"Getting it out—and right" goes further back than the selection of the machine. It may go back 10 or 20 or 40 years to some point or problem solved in our 60 years' development of Presses that produce.

If you want machines with production capacity based on *longest* practical experience, buy "Bliss."

JENCKES

Shell Machinery

For 18 pdr. and 75 mm. Shells

The main features of these machines are their strength and air operation; this enables the machine to stand up under continuous and hard usage. A novice can get the same production as an experienced operator. That is why it obtained a very broad reputation as a production increaser. That is why it is being preferred now. Complete details upon request.

For 4.5", 6" and 155 mm. Shells

So constructed that shells may easily be turned. Strength of drive and convenience and ease of air chuck feature the operation of this machine. We will give full details upon request. Write us and let us both benefit by our mutual co-operation.

CENSORED

The Arrow Electric Co., of Hartford, showed us the production record of this press and operator. —— thousand blanks per day!

It was better than we are willing to promise, even for a "BLISS" Press. So the blue pencil went through the figures. The operator and the character of the work are each factors in the production rate, as well as the efficiency of the press—and we can make promises only for the latter.

Over 100 other similar "BLISS" Presses are being operated by the same company.

Section No. 2-A tells about Inclinables.

Some People Think

that this tool is suitable only for fine pitches. As a matter of fact hundreds of them are being used for 6-pitch threads, and in at least one case that we know of, for 5-pitch in 15-point carbon steel.

10 CUTS—JOB'S DONE. No excuse or chance to waste time by taking twice as many shaving cuts. If you cut many threads in the lathe it will pay you to investigate this tool.

RICE LEWIS & SON

LIMITED

ESTABLISHED 1834 19 VICTORIA STREET

TORONTO, ONTARIO

MANUFACTURERS' SUPPLIES

We carry ready for immediate shipment a large and varied stock of

Machine Shop, Foundry, Factory and Construction Supplies

Our line includes :

HACK SAW BLADES,
MACHINE SCREWS,
STARRETT, BROWN & SHARPE AND OTHER MACHINISTS' TOOLS,
SET SCREWS,
CAP SCREWS,
DRILLS, CARBON AND HIGH SPEED,
FILES (Extra Large Stock).

IRON AND STEEL

WE carry a heavy stock of Bar Iron, Sheet Iron (black and galvanized), Machine Steel, Cast Steel, High Speed Steel, Cold Rolled Steel, etc.

Pleased to quote prices and time of delivery on receipt of specifications.

WE have been in the hardware and metal supply business for 70 years and our products are favorably known throughout Canada. We handle only reliable lines and aim to give satisfactory service to all our customers whether their orders be big or small.

PROMPT DELIVERIES

Tool Room Precision

Nicest accuracy in the making of your tools is a road to profit that your better judgment will not overlook. It means speed in your shop as well as work far within a hairbreadth of absolute perfection.

Mulliner Quick Change Lathe

is guaranteed to bore and turn true within .001 inch. Still it is rugged enough to stand long and heavy strain. Its quick change mechanism provides 37 different threads and feeds. Accurately cut gears of special tumbler-gear design ensure smooth and quiet engagements.

Both front and rear journals are self-adjusting and also adjustable independent of each other.

The headstock spindle is special carbon hammered crucible steel.

Mulliner Lathe illustrated features the ring self-oiling system and is equipped with all tool-room attachments.

Write for additional facts.

re: DEAN CLEANER.

Gentlemen:

I wish to say that since using the DEAN, I have effected a great saving in fuel.

Previous to its use, I burned the best R.O.M. coal——now I burn screenings and only a little more than half the quantity, at the same time developing about 15 H.P. more than before.

I think that if the DEAN CLEANER was better known to engineers in Canada, they would not care to be without it. I would willingly demonstrate its good points to any engineer who might have any doubt about it----

BUT--- I could not show results, as I have no scale on the boilers to come off.

Yours very truly.
Geo. Farrow
Engineer.

Conserve the Coal Supply by Using the

Dean
REG. U.S. PAT. OFF.

Boiler Tube Cleaner

Every engineer knows that clean boiler tubes mean better steaming. But not every one can be convinced that if he keeps his tubes free from ALL scale, he can frequently, by experimenting, use cheaper fuel—and still develop the same, or greater, horsepower.

Mr. Farrow used to burn the best run-of-mine coal. His employers thought the coal bills were too high. It seemed that substantial economies could be effected. So, a **Dean Boiler Tube Cleaner** was installed on trial.

(See Mr. Farrow's letter above for statement of results.)

We do not advance the argument that you can use the Dean Cleaner and equal Mr. Farrow's results. Possibly you have already solved this problem. But, we do believe that if you used the Dean, it would produce surprising results and be a valuable addition to your plant.

The great secret of the Dean Cleaner's success lies in the fact that it does not leave a particle of scale in the boiler, as so many other cleaners do, but **removes it ALL**, thus bringing into the most direct contact the heat and water.

A request for description of the Dean Cleaner will bring a prompt response, including details of free trial offer.

The Wm. B. Pierce Co.

CAXTON BLDG., BUFFALO, N.Y.

C.M.C.

Machine Tools for Many Purposes

C.M.C. machine tools are built for speed and accurate work. They represent the highest type of machine tool construction.

Our machine tools include—**Lathes, shapers, drills, hammers, planers, slotters, punches, shears, presses, and special machinery of all classes.**

Quickest possible attention given to all orders and enquiries.
